

Package ‘libcoin’

March 16, 2026

Title Linear Test Statistics for Permutation Inference

Date 2026-03-11

Version 1.0-12

Description Basic infrastructure for linear test statistics and permutation inference in the framework of Strasser and Weber (1999) <<https://epub.wu.ac.at/102/>>. This package must not be used by end-users. CRAN package 'coin' implements all user interfaces and is ready to be used by anyone.

Depends R (>= 3.4.0)

Suggests coin, bibtex

Imports stats, mvtnorm

LinkingTo mvtnorm

NeedsCompilation yes

License GPL-2

LinStatExpCov	3
Index	6

ctabs	<i>Cross Tabulation</i>
-------	-------------------------

Description

Efficient weighted cross tabulation of two factors and a block

Usage

```
ctabs(ix, iy = integer(0), block = integer(0), weights = integer(0),
      subset = integer(0), checkNAs = TRUE)
```

Arguments

ix	a integer of positive values with zero indicating a missing.
iy	an optional integer of positive values with zero indicating a missing.
block	an optional blocking factor without missings.
weights	an optional vector of case weights, integer or double.
subset	an optional integer vector indicating a subset.
checkNAs	a logical for switching off missing value checks.

Details

A faster version of `xtabs(weights ~ ix + iy + block, subset)`.

Value

If `block` is present, a three-way table. Otherwise, a one- or two-dimensional table.

Examples

```
ctabs(ix = 1:5, iy = 1:5, weights = 1:5 / 5)
```

doTest	<i>Permutation Test</i>
--------	-------------------------

Description

Perform permutation test for a linear statistic

Usage

```
doTest(object, teststat = c("maximum", "quadratic", "scalar"),
       alternative = c("two.sided", "less", "greater"), pvalue = TRUE,
       lower = FALSE, log = FALSE, PermutedStatistics = FALSE,
       minbucket = 10L, ordered = TRUE, maxselect = object$Xfactor,
       pargs = GenzBretz())
```

Arguments

object	an object returned by LinStatExpCov .
teststat	type of test statistic to use.
alternative	alternative for scalar or maximum-type statistics.
pvalue	a logical indicating if a p-value shall be computed.
lower	a logical indicating if a p-value (lower is FALSE) or 1 - p-value (lower is TRUE) shall be returned.
log	a logical, if TRUE probabilities are log-probabilities.
PermutedStatistics	a logical, return permuted test statistics.
minbucket	minimum weight in either of two groups for maximally selected statistics.
ordered	a logical, if TRUE maximally selected statistics assume that the cutpoints are ordered.
maxselect	a logical, if TRUE maximally selected statistics are computed. This requires that X was an implicitly defined design matrix in LinStatExpCov .
pargs	arguments as in GenzBretz .

Details

Computes a test statistic, a corresponding p-value and, optionally, cutpoints for maximally selected statistics.

Value

A list.

 LinStatExpCov

Linear Statistics with Expectation and Covariance

Description

Strasser-Weber type linear statistics and their expectation and covariance under the independence hypothesis

Usage

```
LinStatExpCov(X, Y, ix = NULL, iy = NULL, weights = integer(0),
              subset = integer(0), block = integer(0), checkNAs = TRUE,
              varonly = FALSE, nresample = 0, standardise = FALSE,
              tol = sqrt(.Machine$double.eps))
lmult(x, object)
```

Arguments

<code>X</code>	numeric matrix of transformations.
<code>Y</code>	numeric matrix of influence functions.
<code>ix</code>	an optional integer vector expanding <code>X</code> .
<code>iy</code>	an optional integer vector expanding <code>Y</code> .
<code>weights</code>	an optional integer vector of non-negative case weights.
<code>subset</code>	an optional integer vector defining a subset of observations.
<code>block</code>	an optional factor defining independent blocks of observations.
<code>checkNAs</code>	a logical for switching off missing value checks. This included switching off checks for suitable values of <code>subset</code> . Use at your own risk.
<code>varonly</code>	a logical asking for variances only.
<code>nresample</code>	an integer defining the number of permuted statistics to draw.
<code>standardise</code>	a logical asking to standardise the permuted statistics.
<code>tol</code>	tolerance for zero variances.
<code>x</code>	a contrast matrix to be left-multiplied in case <code>X</code> was a factor.
<code>object</code>	an object of class "LinStatExpCov".

Details

This function implements the permutation test framework by Strasser and Weber (1999), see also Hothorn, Hornik, van de Wiel, and Zeileis (2006) and Hothorn, Hornik, van de Wiel, and Zeileis (2008).

The function, after minimal preprocessing, calls the underlying C code and computes the linear statistic, its expectation and covariance and, optionally, `nresample` samples from its permutation distribution.

When both `ix` and `iy` are missing, the number of rows of `X` and `Y` is the same, ie the number of observations.

When `X` is missing and `ix` a factor, the code proceeds as if `X` were a dummy matrix of `ix` without explicitly computing this matrix.

Both `ix` and `iy` being present means the code treats them as subsetting vectors for `X` and `Y`. Note that `ix = 0` or `iy = 0` means that the corresponding observation is missing and the first row or `X` and `Y` must be zero.

`lmult` allows left-multiplication of a contrast matrix when `X` was (equivalent to) a factor.

Value

A list.
