NOTE

This manual is in the process of being revised to cover the latest stable release version of KiCad. It contains some sections that have not yet been completed. We ask for your patience while our volunteer technical writers work on this task, and we welcome new contributors who would like to help make KiCad's documentation better than ever.

The KiCad project welcomes feedback, bug reports, and suggestions related to the software or its documentation. For more information on how to submit feedback or report an issue, please see the instructions at <https://www.kicad.org/help/report-an-issue/>

Introduction to the KiCad Schematic Editor

Описание

The KiCad Schematic Editor is a schematic capture software distributed as a part of KiCad and available under the following operating systems:

- Linux
- Apple macOS
- Windows

Regardless of the OS, all KiCad files are 100% compatible from one OS to another.

The Schematic Editor is an integrated application where all functions of drawing, control, layout, library management and access to the PCB design software are carried out within the editor itself.

The KiCad Schematic Editor is intended to cooperate with the KiCad PCB Editor, which is KiCad's printed circuit design software. It can also export netlist files, which lists all the electrical connections, for other packages.

The Schematic Editor includes a symbol library editor, which can create and edit symbols and manage libraries. It also integrates the following additional but essential functions needed for modern schematic capture software:

- Проверка электрических правил проектирования (ERC) для автоматического обнаружения неверных или пропущенных соединений.
- Экспорт изображения схемы в файлы различных форматов (Postscript, PDF, HPGL и SVG).
- Генератор перечня элементов (BOM) различных форматов с помощью внешних инструментов.

The Schematic Editor supports multi-sheet schematics in several ways:

- Flat hierarchies (schematic sheets are not explicitly connected in a master diagram).
- Simple hierarchies (each schematic sheet is used only once).
- Complex hierarchies (some schematic sheets are used multiple times).

Hierarchical schematics are described in detail [later in the manual](#).

Начальная настройка

When the Schematic Editor is run for the first time, if the the global symbol library table file `sym-lib-table` is not found in the KiCad configuration folder then KiCad will ask how to create this file:

Configure Global Symbol Library Table

KiCad has been run for the first time using the new symbol library table for accessing libraries. In order for KiCad to access symbol libraries, you must configure your global symbol library table. Please select from one of the options below. If you are not sure which option to select, please use the default selection.

- Copy default global symbol library table (recommended)
- Copy custom global symbol library table
- Create an empty global symbol library table

Select global symbol library table file:

(None)

OK

The first option is recommended (**Copy default global symbol library table (recommended)**). The default symbol library table includes all of the standard symbol libraries that are installed as part of KiCad.

If this option is disabled, KiCad was unable to find the default global symbol library table. This probably means you did not install the standard symbol libraries with KiCad, or they are not installed where KiCad expects to find them. On some systems the KiCad libraries are installed as a separate package.

- If you have installed the standard KiCad symbol libraries and want to use them, but the first option is disabled, select the second option and browse to the `sym-lib-table` file in the directory where the KiCad libraries were installed.
- If you already have a custom symbol library table that you would like to use, select the second option and browse to your `sym-lib-table` file.
- If you want to construct a new symbol library table from scratch, select the third option.

Symbol library management is described in more detail [later](#).

The Schematic Editor User Interface

The main Schematic Editor user interface is shown above. The center contains the main editing canvas, which is surrounded by:

- Top toolbars (file management, zoom tools, editing tools)
- Left toolbar (display options)
- Message panel and status bar at bottom
- Right panel (drawing and design tools)

Navigating the editing canvas

The editing canvas displays the schematic being designed. You can pan and zoom to different parts of the schematic and open any schematic sheet in the design.

By default, dragging with the middle or right mouse button will pan the canvas view and scrolling the mouse wheel will zoom the view in or out. You can change this behavior in the Mouse and Touchpad section of the preferences (see [Configuration and Customization](#) for details).

Several other zoom tools are available in the top toolbar:

-  zooms in on the center of the viewport.

-  zooms out from the center of the viewport.
-  zooms to fit the frame around the drawing sheet.
-  zooms to fit the items within the drawing sheet.
-  allows you to draw a box to determine the zoomed area.

The cursor's current position is displayed at the bottom of the window (X and Y), along with the current zoom factor (Z), the cursor's relative position (dx, dy, and dist), the grid setting, and the display units.

The relative coordinates can be reset to zero by pressing . This is useful for measuring distance between two points or aligning objects.

Горячие клавиши

The  +  shortcut displays the current hotkey list. The default hotkey list is included in the [Actions Reference](#) section of the manual.

The hotkeys described in this manual use the key labels that appear on a standard PC keyboard. On an Apple keyboard layout, use the  key in place of , and the  key in place of .

Many actions do not have hotkeys assigned by default, but hotkeys can be assigned or redefined using the hotkey editor (**Preferences** → **Preferences...** → **Hotkeys**).

NOTE

Many of the actions available through hotkeys are also available in context menus. To access the context menu, right-click in the editing canvas. Different actions will be available depending on what is selected or what tool is active.

Hotkeys are stored in the file `user.hotkeys` in KiCad's configuration directory. The location is platform-specific:

- Windows: `%APPDATA%\kicad\6.0\user.hotkeys`
- Linux: `~/.config/kicad/6.0/user.hotkeys`
- macOS: `~/Library/Preferences/kicad/6.0/user.hotkeys`

KiCad can import hotkey settings from a `user.hotkeys` file using the **Import Hotkeys** button in the hotkey editor.

Mouse operations and selection

Selecting items in the editing canvas is done with the left mouse button. Single-clicking on an object will select it and dragging will perform a box selection. A box selection from left to right will only select items that are fully inside the box. A box selection from right to left will select any items that touch the box. A left-to-right selection box is drawn in yellow, with a cursor that indicates exclusive selection, and a right-to-left selection box is drawn in blue with a cursor that indicates inclusive selection.

The selection action can be modified by holding modifier keys while clicking or dragging. The following modifier keys apply when clicking to select single items:

| Modifier Keys (Windows) | Modifier Keys (Linux) | Modifier Keys (macOS) | Selection Effect |
|-------------------------|-----------------------|-----------------------|--|
| | | | Add the item to the existing selection. |
| | | | Remove the item from the existing selection. |
| long click | long click or | long click or | Clarify selection from a pop-up menu. |
| | | | Highlight the net of the selected copper item. |

The following modifier keys apply when dragging to perform a box selection:

| Modifier Keys (Windows) | Modifier Keys (Linux) | Modifier Keys (macOS) | Selection Effect |
|-------------------------|-----------------------|-----------------------|---|
| | | | Add item(s) to the existing selection. |
| | | | Remove item(s) from the existing selection. |

Selecting an object displays information about the object in the message panel at the bottom of the window. Double-clicking an object opens a window to edit the object's properties.

Pressing will always cancel the current tool or operation and return to the selection tool. Pressing while the selection tool is active will clear the current selection.

Left toolbar display controls

The left toolbar provides options to change the display of items in the Schematic Editor.

| | |
|----------|--|
| | Turns grid display on/off. Note: by default, hiding the grid will disable grid snapping. This behavior can be changed in the Display Options section of Preferences. |
| | Display/entry of coordinates and dimensions in inches, mils, or millimeters. |
| | Switches between full-screen and small editing cursor (crosshairs). |
| | Turns invisible pin display on/off. |
| | Switches between free angle and horizontal/vertical placement of new wires, buses, and graphical lines. |

Создание и редактирование схем

Введение

A schematic designed with KiCad is more than a simple graphic representation of an electronic device. It is normally the entry point of a development chain that allows for:

- [Проверку электрических правил проектирования](#) для выявления ошибок и упущений.
- Automatically generating a [bill of materials](#).
- [Формировать список цепей](#) для приложений симуляции работы электрических схем, таких как SPICE.
- [Defining a circuit](#) for transferring to PCB layout.

Схема, в основном, состоит из компонентов, проводников, меток, соединений, шин и символов питания. Помимо этого, можно размещать и графические элементы, такие как выводы соединения с шиной, текстовые комментарии и графические линии.

Symbols are added to the schematic from symbol libraries. After the schematic is made, the set of connections and footprints is imported into the PCB editor for designing a board.

Schematics can be contained in a single sheet or split among multiple sheets. In KiCad, multi-sheet schematics are organized hierarchically, with a root sheet and sub-sheet(s). Each sheet is its own `.kicad_sch` file and is itself a complete KiCad schematic. Working with hierarchical schematics is described in the [Hierarchical Schematics](#) chapter.

Schematic editing operations

Schematic editing tools are located in the right toolbar. When a tool is activated, it stays active until a different tool is selected or the tool is canceled with the `Esc` key. The selection tool is always activated when any other tool is canceled.

| | |
|---|---|
|  | Selection tool (the default tool) |
|  | Highlight a net by marking its wires and net labels with a different color. If the PCB Editor is also open then copper corresponding to the selected net will be highlighted as well. Net highlighting can be cleared by clicking with the highlight tool in an empty space, or by using the Clear Net Highlighting hotkey (). |
|  | Display the symbol selector dialog to place a new symbol. |
|  | Display the power symbol selector dialog to place a new power symbol. |
|  | Draw a wire. |
|  | Draw a bus. |
|  | Draw wire-to-bus entry points. These elements are only graphical and do not create a connection, thus they should not be used to connect wires together. |
|  | Place a "No Connect" flag. These flags should be placed on symbol pins which are meant to be left unconnected. "No connect" flags indicate to the Electrical Rule Checker that the pin is intentionally unconnected and not an error. |
|  | Place a junction. This connects two crossing wires or a wire and a pin, which can sometimes be ambiguous without a junction (i.e. if a wire end or a pin is not directly connected to another wire end). |
|  | Place a local label. Local labels connect items located in the same sheet . For connections between two different sheets, use global or hierarchical labels. |
|  | Place a global label. All global labels with the same name are connected, even when located on different sheets. |
|  | Place a hierarchical label. Hierarchical labels are used to create a connection between a subsheet and the sheet's parent sheet. See the Hierarchical Schematics section for more information about hierarchical labels, sheets, and pins. |
|  | Place a hierarchical subsheet. You must specify the file name for this subsheet. |
|  | Import a hierarchical pin from a subsheet. This command can be executed only on hierarchical subsheets. It will create hierarchical pins corresponding to hierarchical labels placed in the target subsheet. |
|  | Draw lines. Note: Lines are graphical objects and are not the same as wires placed with the Wire tool. They do not connect anything. |
|  | Place a text comment. |
|  | Place a bitmap image. |
|  | Delete clicked items. |

Grids

In the Schematic Editor the cursor always moves over a grid. The grid can be customized:

- Size can be changed using the right click menu or using **View** → **Grid Properties...**
- Color can be changed in the **Colors** page of the **Preferences** dialog (menu **Preferences** → **General Options**).
- Visibility can be switched using the left-hand toolbar button.

The default grid size is 50 mil (0.050") or 1.27 millimeters.

This is the recommended grid for placing symbols and wires in a schematic, and for placing pins when designing a symbol in the Symbol Editor.

NOTE

Wires connect with other wires or pins only if their ends coincide **exactly**. Therefore it is very important to keep symbol pins and wires aligned to the grid. It is recommended to always use a 50 mil grid when placing symbols and drawing wires because the KiCad standard symbol library and all libraries that follow its style also use a 50 mil grid. **Using a grid size other than 50 mil will result in schematics without proper connectivity!**

Smaller grids can also be used, but this is intended only for text and symbol graphics, and not recommended for placing pins and wires.

NOTE

Symbols, wires, and other elements that are not aligned to the grid can be snapped back to the grid by selecting them, right clicking, and clicking **Align Elements to Grid**.

Snapping

Schematic elements such as symbols, wires, text, and graphic lines are snapped to the grid when moving, dragging, and drawing them. Additionally, the wire tool snaps to pins even when grid snapping is disabled. Both grid and pin snapping can be disabled while moving the mouse by using the modifier keys in the table below.

NOTE

On Apple keyboards, use the **Cmd** key instead of **Ctrl**.

| Modifier Key | Effect |
|--------------|---------------------------------|
| Ctrl | Disable grid snapping. |
| Shift | Disable snapping wires to pins. |

Working with symbols

Placing symbols

To load a symbol into your schematic you can use the icon . A dialog box allows you to type the name of the symbol to load.

The Choose Symbols dialog will filter symbols by name, keywords, and description according to what you type into the search field.

Some advanced filters are available:

- **Wildcards:** use the characters `?` and `*` respectively to mean "any single character or no characters" and "any number of any characters, including none".
- **Key-value pairs:** if a library part's description or keywords contain a tag of the format "Key:123", you can match relative to that by typing "Key>123" (greater than), "Key<123" (less than), etc. Numbers may include one of the following case-insensitive suffixes:

| | | | | | | | |
|------------|-----------|-----------|-----------|--------|--------|--------|-----------|
| p | n | u | m | k | meg | g | t |
| 10^{-12} | 10^{-9} | 10^{-6} | 10^{-3} | 10^3 | 10^6 | 10^9 | 10^{12} |

| | | | |
|----------|----------|----------|----------|
| ki | mi | gi | ti |
| 2^{10} | 2^{20} | 2^{30} | 2^{40} |

- **Regular expressions:** if you're familiar with regular expressions, these can be used too. The regular expression flavor used is the [wxWidgets Advanced Regular Expression style](#), which is similar to Perl regular expressions.

If the symbol specifies a default footprint, this footprint will be previewed in the lower right. If the symbol includes footprint filters, alternate footprints that satisfy the footprint filters can be selected in the footprint dropdown menu at right.

After selecting a symbol to place, the symbol will be attached to the cursor. Left clicking the desired location in the schematic places the symbol into the schematic. Before placing the symbol in the schematic, you can rotate it, mirror it, and edit its fields, by either using the hotkeys or the right-click context menu. These actions can also be performed after placement.

Так выглядит компонент в процессе расположения:

If the **Place repeated copies** option is checked, after placing a symbol KiCad will start placing another copy of the symbol. This process continues until the user presses **Esc**.

For symbols with multiple units, if the **Place all units** option is checked, after placing the symbol KiCad will start placing the next unit in the symbol. This continues until the last unit has been placed or the user presses **Esc**.

Placing power ports

A **power port symbol** is a symbol representing a connection to a power net. The symbols are grouped in the **power** library, so they can be placed using the symbol chooser. However, as power placements are frequent, the **⏏** tool is available. This tool is similar, except that the search is done directly in the **power** library and any other library that contains power symbols.

Moving symbols

Symbols can be moved using the Move (**M**) or Drag (**G**) tools. These tools act on the selected symbol, or if no symbol is selected they act on the symbol under the cursor.

The **Move** tool moves the symbol itself without maintaining wired connections to the symbol pins.

The **Drag** tool moves the symbol without breaking wired connections to its pins, and therefore moves the connected wires as well.

You can also Drag symbols by clicking and dragging them with the mouse, depending on the **Left button drag gesture** setting in the **Mouse and Touchpad** section of Preferences.

Symbols can also be rotated (**R**) or mirrored in the X (**X**) or Y (**Y**) directions.

Editing symbol properties

A symbol's fields can be edited in the symbol's Properties window. Open the Symbol Properties window for a symbol with the **E** hotkey or by double-clicking on the symbol.

The Symbol Properties window displays all the fields of a symbol in a table. New fields can be added, and existing fields can be deleted, edited, reordered, moved, or resized.

Каждое поле можно показать или спрятать, отобразить горизонтально или вертикально. Указанная позиция всегда соответствует нормально расположенному компоненту (без поворотов и отражения) и относительно точки привязки компонента.

The position and orientation properties of each field may be hidden in this dialog. They can be shown by right-clicking on the column header of the fields table and enabling the "Orientation", "X Position", and/or "Y Position" columns. Other columns can be shown or hidden as desired.

The "Update Symbol from Library..." button is used to update the schematic's copy of the symbol to match the copy in the library. The "Change Symbol..." button is used to swap the current symbol to a different symbol in the library.

"Edit Symbol..." opens the Symbol Editor to edit the copy of the symbol in the schematic. Note that the original symbol in the library will not be modified. The "Edit Library Symbol..." button opens the Symbol Editor to edit the original symbol in the library. In this case, the symbol in the schematic will not be modified until the user clicks the "Update Symbol from Library..." button.

Editing symbol fields individually

An individual symbol text field can be edited directly with the **E** hotkey (with a field selected instead of a symbol) or by double-clicking on the field.

Some symbol fields have their own hotkey to edit them directly. With the symbol selected, the Reference, Value, and Footprint fields can be edited with the **U**, **V**, or **F** hotkeys, respectively.

The options in this dialog are the same as those in the full Symbol Properties dialog, but are specific to a single field.

Symbol fields can be automatically moved to an appropriate location with the Autoplace Fields action (select a symbol and press **O**). Field autoplacement is configurable in the Schematic Editor's Editing Options, including a setting to always autoplace fields.

Symbol Fields Table

The Symbol Fields Table allows you to view and modify field values for all symbols in a spreadsheet interface. You can open the Symbol Fields Table with the  button.

| Reference | Value | Footprint | Datasheet | Qty |

Cells are navigated with the arrow keys, or with **Tab** / **Shift** + **Tab** to move right / left and **Enter** / **Shift** + **Enter** to move down / up, respectively.

A range of cells can be selected by clicking and dragging. The whole range of selected cells will be copied (**Ctrl** + **C**) or pasted into (**Ctrl** + **V**) on a copy or paste action. Copying a range of cells from the table can be useful for creating a BOM. More details of copying and pasting cells are described below.

Any symbol field can be shown or hidden using the **Show** checkboxes on the left, or by right-clicking on the header of the table. New symbol fields can be added using the **Add Field...** button.

Similar symbols can optionally be grouped by any symbol field using the **Group By** checkboxes. Grouped symbols are shown in a single row in the table. The grouped row can be expanded to show the individual symbols by clicking the arrow at the left of the row.

Tricks to simplify filling fields

There are several special copy/paste methods in the spreadsheet for pasting values into larger regions, including auto-incrementing pasted cells. These features may be useful when pasting values that are shared in several symbols.

Эти приёмы показаны ниже.

| 1. Copy (Ctrl + C) | 2. Select target cells | 3. Paste (Ctrl + V) | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|--|------------------------|---------------------|----|----|----|----|----|--|--|----|--|--|---|-----|----|--|----|----|----|----|--|--|----|--|--|---|-----|----|----|----|----|--|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| <table border="1"> <tr><td>abc</td><td></td><td></td></tr> <tr><td></td><td></td><td></td></tr> <tr><td></td><td></td><td></td></tr> <tr><td></td><td></td><td></td></tr> </table> | abc | | | | | | | | | | | | <table border="1"> <tr><td>abc</td><td></td><td></td></tr> <tr><td></td><td></td><td></td></tr> <tr><td></td><td></td><td></td></tr> <tr><td></td><td></td><td></td></tr> </table> | abc | | | | | | | | | | | | <table border="1"> <tr><td>abc</td><td></td><td></td></tr> <tr><td></td><td></td><td></td></tr> <tr><td></td><td></td><td></td></tr> <tr><td></td><td></td><td></td></tr> </table> | abc | | | | | | | | | | | | | | | | | | | | |

NOTE

Данные методы также доступны и в таблицах других диалоговых окон.

Reference Designators and Symbol Annotation

Reference designators are unique identifiers for components in a design. They are often printed on a PCB and in assembly diagrams, and allow you to match symbols in a schematic to the corresponding components on a board.

In KiCad, reference designators consist of a letter indicating the type of component (R for resistor, C for capacitor, U for IC, etc.) followed by a number. If the symbol has multiple units then the reference designator will also have a trailing letter indicating the unit. Symbols that don't have a reference designator set have a ? character instead of the number. Reference designators must be unique.

Reference designators can be set manually by editing a symbol's reference designator field, or automatically using the Annotation tool.

NOTE | The process of setting a symbol's reference designator is called **annotation**.

Инструмент обозначения элементов

The Annotation tool automatically assigns reference designators to symbols in the schematic. To launch the Annotation tool, click the  button in the top toolbar.

The tool provides several options to control how symbols are annotated.

Scope: Selects whether annotation is applied to the entire schematic, to only the current sheet, or to only the selected symbols.

Options: Selects whether annotation should apply to all symbols and reset *existing reference designators, or apply only to unannotated symbols.

Order: Chooses the direction of numbering. If symbols are sorted by X position, all symbols on the left side of a schematic sheet will be lower numbered than symbols on the right side of the sheet. If symbols are sorted by Y position, all symbols on the top of a sheet will be lower numbered than symbols at the bottom of the sheet.

Numbering: Selects the starting point for numbering reference designators. The lowest unused number above the starting point is picked for each reference designator. The starting point can be an arbitrary number (typically zero), or it can be the sheet number multiplied by 100 or 1000 so that each part's reference designator corresponds to the schematic page it is on.

The **Clear Annotation** button clears all reference designators in the selected scope.

Annotation messages can be filtered with the checkboxes at the bottom or saved to a report using the **Save...** button.

Electrical Connections

There are two primary ways to establish connections: wires and labels. Both are shown in the schematic below.

Connections can also be made with buses and with implicit connections via hidden power pins.

This section will also discuss two special types of symbols that can be added with the "Power port" button on the right toolbar:

Power ports: symbols for connecting wires to a power or ground net.

- **PWR_FLAG:** a specific symbol for indicating that a net is powered when it is not connected to a power output pin (for example, a power net that is supplied by an off-board connector).

Label Connections

Labels are used to assign net names to wires and pins. Wires with the same net name are considered to be connected. A net can only have one name. If two different labels are placed on the same net, an ERC violation will be generated. Only one of the net names will be used in the netlist.

There are three types of labels, each with a different connection scope.

- **Local labels**, also referred to simply as labels, only make connections within a sheet. Add a local label with the **A** button in the right toolbar.
- **Global labels** make connections anywhere in a schematic, regardless of sheet. Add a global label with the  button in the right toolbar.
- **Hierarchical labels** connect to hierarchical sheet pins and are used in [hierarchical schematics](#) for connecting child sheets to their parent sheet. Add a hierarchical label with the  in the right toolbar.

NOTE

Labels that have the same name will connect, regardless of the label type, if they are in the same sheet.

After using the appropriate button or hotkey to create a label, the Label Properties dialog appears.

The image shows the 'Global Label Properties' dialog box. It has a title bar with a close button and a maximize button. The main area contains a 'Label:' text box, a 'Text Size:' field set to '50' with 'mils' as the unit, and a 'Syntax help' link. Below this is a note: 'The margins around the text are controlled by the text offset ratio in Schematic Setup > General > Formatting.' There are three sections: 'Justification' with radio buttons for 'Align right', 'Align bottom', 'Align left' (selected), and 'Align top'; 'Style' with radio buttons for 'Normal' (selected), 'Italic', 'Bold', and 'Bold and italic'; and 'Shape' with radio buttons for 'Input' (selected), 'Output', 'Bidirectional', 'Tri-state', and 'Passive'. At the bottom are 'Cancel' and 'OK' buttons.

The **Label** field sets the label's text, which determines the net that the label assigns to its attached wire. Label text supports [markup](#) for overbars, subscripts, etc., as well as [variable substitution](#). Use the **Syntax help** link in the dialog for a summary.

Justification sets the position of the label's connection point relative to the label's text. For example, when **Align right** is selected the connection point will be to the right of the text.

Text size and **Style** control the appearance of the label's text. **Shape** controls the shape of the outline around the label; this is purely visual and has no electrical consequence. Local labels do not have an outline, and therefore do not have **Shape** options.

NOTE

Global labels have additional settings to control margins around the label text in the [Schematic Setup dialog](#).

After accepting the label properties, the label is attached to the cursor for placement. The connection point for a label is the small square in the corner of the label. The square disappears when the label is connected to a wire or the end of a pin.

The connection point's position relative to the label text can be changed by choosing a different label orientation in the label's properties, or by mirroring/rotating the label.

The Label Properties dialog can be accessed at any time by selecting a label and using the **E** hotkey, double-clicking on the label, or with **Properties...** in the right-click context menu.

Wire Connections

To establish a connection, a segment of wire must be connected by its end to another segment or to a pin. Only wire ends create connections; if a wire crosses the middle of another wire, a connection will not be made.

Unconnected wire ends have a small square that indicates the connection point. The square disappears when a connection is made to the wire end. Unconnected pins have a circle, which also disappears when a connection is made.

NOTE

Wires connect with other wires or pins only if their ends coincide exactly. Therefore it is important to keep symbol pins and wires aligned to the grid. It is recommended to always use a 50 mil grid when placing symbols and drawing wires because the KiCad standard symbol library and all libraries that follow its style also use a 50 mil grid.

NOTE

Symbols, wires, and other elements that are not aligned to the grid can be snapped back to the grid by selecting them, right clicking, and selecting **Align Elements to Grid**.

Drawing and editing wires

To begin connecting elements with wire, use the Wire tool  in the right toolbar (**W**). Wires can also be automatically started by clicking on an unconnected symbol pin or wire end.

Wires can be moved using the Move (**M**) or Drag (**G**) tools. As with symbols, the **Move** tool moves only the selected segment, without maintaining existing connections to other segments. The **Drag** tool maintains

existing connections.

If a segment is selected or the cursor is over the middle of a wire, the move/drag action will move the entire segment. If the cursor is over a corner or wire end, the move/drag action will act on one end of the segment.

Wire Junctions

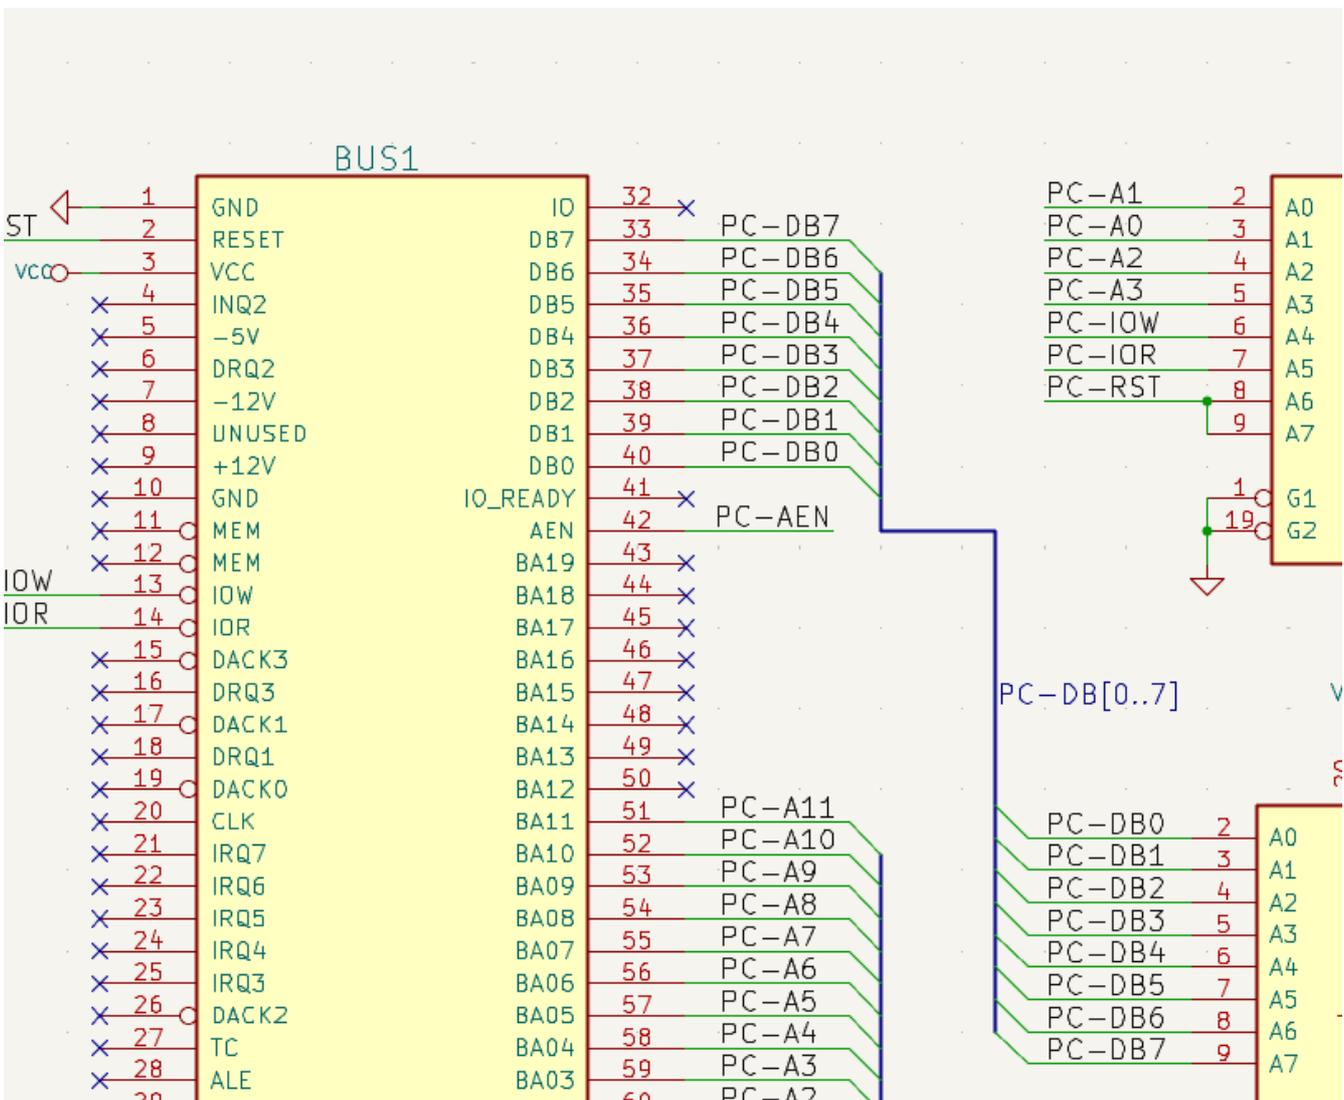

Wires that cross are not implicitly connected. It is necessary to join them by explicitly adding a junction dot if a connection is desired (⊙ button in the right toolbar). Junction dots will be automatically added to wires that start or end on top of an existing wire.

Junction dots are used in the schematic figure above on the wires connected to P1 pins 18, 19, 20, 21, 22, and 23.

Bus Connections

Buses are a way to group related signals in the schematic in order to simplify complicated designs. Buses can be drawn like wires using the bus tool (— button), and are named using labels the same way signal wires are.

In the following schematic, many pins are connected to buses, which are the thick blue lines in the center.

Сигналы шины

There are two types of bus in KiCad 6.0 and later: vector buses and group buses.

Векторные шины — это совокупность сигналов, наименования которых начинаются с общего префикса и заканчиваются порядковым номером. Векторным шинам присваиваются имена вида `<PREFIX>[M..N]`, где `PREFIX` — префикс, соответствующий правилам именования меток, `M` — первый номер в виде суффикса, `N` — последний номер в виде суффикса. Например, шина `DATA[0..7]` состоит из сигналов `DATA0`, `DATA1` и так далее до `DATA7`. Не имеет значения в каком порядке указаны `M` и `N`, но они не должны быть отрицательными.

Групповые шины — это совокупность одного или нескольких сигналов и/или векторных шин. Групповые шины могут объединять в себе связанные сигналы, даже если они имеют различные имена. Такие шины используют особый синтаксис меток:

```
<OPTIONAL_NAME>{SIGNAL1 SIGNAL2 SIGNAL3}
```

Сигналы группы перечисляют внутри фигурных скобок (`{}`), разделяя символом пробела. Наименование группы указывается перед открывающейся фигурной скобкой, но оно не обязательное. Если группа не имеет имени, цепи на печатной плате получают имена сигналов, указанные в группе. Если же группа имеет имя, то это имя будет добавлено к имени сигнала в виде префикса, отделённого точкой (`.`).

Например, шина `{SCL, SDA}` имеет два сигнала. В списке цепей эти сигналы будут указаны как `SCL` и `SDA`. А для шины `USB1{DP DM}` будут сформированы цепи с именами `USB1.DP` и `USB1.DM`. В проектах с объёмными шинами, которые повторяются на нескольких листах схемы, использование групповых шин экономит время.

Групповые шины также могут включать в себя векторные шины. Например, шина `MEMORY{A[7..0] D[7..0] OE WE}` содержит как векторные шины, так и обычные сигналы, а в результате на плате будут получены такие сигналы как `MEMORY.A7`, `MEMORY.OE` и т.п.

Bus wires can be drawn and connected in the same manner as signal wires, including using junctions to create connections between crossing wires. Like signals, buses cannot have more than one name — if two conflicting labels are attached to the same bus, an ERC violation will be generated.

Соединение сигналов шины

Pins connected between the same members of a bus must be connected by labels. It is not possible to connect a pin directly to a bus; this type of connection will be ignored by KiCad.

На приведённом выше примере, соединения выполнены с помощью меток, расположенных на проводниках, которые подключены к выводам. Ввод шины (отрезок проводника под углом 45 градусов) всего лишь графический элемент и не требуется для создания логической связи.

In fact, using the repetition command (`Insert`), connections can be very quickly made in the following way, if component pins are aligned in increasing order (a common case in practice on components such as memories, microprocessors...):

- Place the first label (for example `PCA0`)
- Use the repetition command as much as needed to place members. KiCad will automatically create the next labels (`PCA1`, `PCA2` ...) vertically aligned, theoretically on the position of the other pins.
- Начертить проводник под первой меткой. Затем использовать команду повторения для размещения остальных проводников под остальными метками.

Если необходимо, расположите вводы в шину таким же образом (сначала расположите первый ввод, затем остальные с помощью команды повторения).

NOTE

In the **Schematic Editor** → **Editing Options** section of the Preferences menu, you can set the repetition parameters:

- Horizontal pitch
- Vertical pitch
- Label increment (labels can be incremented or decremented by 1, 2, 3, etc.)

Ответвление проводников от шины

The unfold tool allows you to quickly break out signals from a bus. To unfold a signal, right-click on a bus object (a bus wire, etc) and choose **Unfold from Bus**. Alternatively, use the **Unfold Bus** hotkey (default: **C**) when the cursor is over a bus object. The menu allows you to select which bus member to unfold.

После выбора сигнала шины, с помощью мыши нужно указать место расположения метки. Инструмент ответвления автоматически создаст ввод проводника в шину и проводник от ввода до метки. После расположения метки на схеме, черчение проводника не заканчивается, можно и дальше вести проводник (например, к выводу компонента) или завершить его, как при обычном черчении проводников.

Псевдонимы шин

Псевдонимы шин — это ярлыки, позволяющие работать с объёмными групповыми шинами более эффективно. Они позволяют задать короткое имя для групповой шины (перечня сигналов) и затем использовать его при обозначении шины на схеме, вместо перечисления сигналов.

To create bus aliases, open the **Bus Definitions** dialog in the **Tools** menu.

Имя псевдонима должно соответствовать требованиям именования меток. С помощью диалогового окна можно добавлять сигналы или векторные шины к псевдониму. Для экономии времени, можно вводить или вставлять сигналы и/или шины через пробел, они будут разделены и добавлены по отдельности. На показанном примере определён псевдоним с именем `USB`, содержащий сигналы `DP`, `DM` и `VBUS`.

После создания псевдонима, его можно использовать в метках групповых шин, вставляя имя псевдонима внутри фигурных скобок вместо перечня сигналов: `{USB}`. Эта запись эквивалентна метке `{DP DM VBUS}`. Можно добавить имя шины в виде префикса: `USB1{USB}`, в результате чего цепи получают имена типа `USB1.DP` и т.д., как описано выше. Для сложных шин, использование псевдонимов позволяет значительно сократить метки шин на схеме. Нужно помнить, что псевдоним — это всего лишь ярлык, сокращение, его имя не попадёт в список цепей.

Псевдонимы шин хранятся в файле схемы. Любой псевдоним, созданный на текущем листе схемы, будет доступен в любом другом иерархическом листе текущего проекта схемы.

Шины с более чем одной меткой

В KiCad версии 5.0 и более ранних допускалось соединение шин с различными метками, что приводило к объединению сигналов этих шин при создании списка цепей. Такое поведение теперь запрещено в KiCad версии 6.0, так как оно не совместимо с групповыми шинами и приводит к проблемам при формировании списка цепей, потому что имя, которое сигнал получит в итоге, сложно предугадать.

При открытии проекта, в котором имеется соединение шин с различными метками, в последних версиях KiCad, будет показано диалоговое окно миграции шин, которое поможет обновить схему так, чтобы у каждой шины осталась только одна метка.

Для каждого соединения шин с несколькими метками нужно выбрать какую из меток оставить. С помощью выпадающего меню можно выбрать одну из присутствующих в схеме меток или ввести новое значение самостоятельно.

Hidden Power Pins

When the power pins of a symbol are visible, they must be connected, as with any other signal. However, symbols such as gates and flip-flops are sometimes drawn with hidden power input pins which are connected implicitly.

KiCad automatically connects invisible pins with type "power input" to a global net with the same name as the pin. For example, if a symbol has a hidden power input pin named `VCC`, this pin will be globally connected to the `VCC` net on all sheets.

NOTE

Hidden pins can be shown in the schematic by checking the **Show hidden pins** option in the **Schematic Editor** → **Display Options** section of the preferences, or by selecting **View** → **Show hidden pins**. There is also a toggle icon  on the left toolbar.

It may be necessary to join power nets of different names (for example, `GND` in TTL components and `VSS` in MOS components). To accomplish this, add a [power port symbol](#) for each net and connect them with a wire.

If hidden power pins are used, it is not recommended to use local labels for power connection, as they will not connect to hidden power pins on other sheets.

NOTE

Care must be taken with hidden power input pins because they can create unintentional connections. By nature, hidden pins are invisible and do not display their pin name. This makes it easy to accidentally connect two power pins to the same net. For this reason, **using invisible power pins in symbols is not recommended** outside of power port symbols, and is only supported for compatibility with legacy designs and symbols.

Power Ports

Power port symbols are conventionally used to connect pins to power nets. Power port symbols have a single pin which is invisible and marked as a power input. As described in the [hidden power pins section](#), any wire connected to the pin of a power port is therefore automatically connected to the power net with the same name as the port's pin.

In the KiCad standard library, power ports are found in the `power` library, but power port symbols can be created in any library. To create a custom power port, make a new symbol with a hidden pin marked as a power input. Name the pin according to the desired power net.

На рисунке ниже показан пример подключения символов питания.

In this example, power ports symbols are used to connect the positive and negative terminals of the capacitors to the `VCC` and `GND` nets, respectively.

Power port symbols are found in the `power` symbol library. They can also be created by drawing a symbol with a hidden "power input" pin that has the name of the desired power net.

PWR_FLAG

Two `PWR_FLAG` symbols are visible in the screenshot above. They indicate to ERC that the two power nets `VCC` and `GND` are actually connected to a power source, as there is no explicit power source such as a voltage regulator output attached to either net.

Without these two flags, the ERC tool would diagnose: *Error: Input Power pin not driven by any Output Power pins.*

The `PWR_FLAG` symbol is found in the `power` symbol library. The same effect can be achieved by connecting any "Power Output" pin to the net.

No-connection flag

No-connection flags (→✕) are used to indicate that a pin is intentionally unconnected. These flags do not have any effect on the schematic's connectivity, but they prevent "unconnected pin" ERC warnings for pins that are intentionally unconnected.

Graphical items

Text and graphic lines

It can be useful to place annotations such as text fields and frames to aid in understanding the schematic. Text fields (T) and graphic lines (→) are intended for this use, as opposed to labels and wires, which are connection elements.

The image below shows graphic lines and text in addition to wires, local labels, and hierarchical labels.

Основная надпись

The title block is edited with the Page Settings tool (☰).

Восстановление кэшированных компонентов

By default, KiCad loads symbols from the project libraries according to the set paths and library order. This can cause a problem when loading a very old project: if the symbols in the library have changed or have been removed or the library no longer exists since they were used in the project, the ones in the project would be automatically replaced with the new versions. The new versions might not line up correctly or might be oriented differently leading to a broken schematic.

When a project is saved, a cache library with the contents of the current library symbols is saved along with the schematic. This allows the project to be distributed without the full libraries. If you load a project where symbols are present both in its cache and in the system libraries, KiCad will scan the libraries for conflicts. Any conflicts found will be listed in the following dialog:

Помощник спасения проекта

Похоже этот проект был сделан с использованием старых библиотек компонентов схемы. Для некоторых частей может потребоваться перекомпоновка в другое имя символа и некоторые символы должны быть "спасены" (клонированы или переименованы) в новой библиотеке.

Следующие изменения рекомендуются для того, чтобы обновить проект.

Символы для обновления:

| Принять | Символ | Действие |
|-------------------------------------|--------|---------------------------------|
| <input checked="" type="checkbox"/> | D | Спаси D как D-RESCUE-test_kicad |

Экземпляры этого символа:

| Обозначение | Значение |
|-------------|----------|
| D? | D |

Кэшированная часть:

Часть библиотеки:

Больше никогда не показывать

You can see in this example that the project originally used a diode with the cathode facing up, but the library now contains one with the cathode facing down. This change would break the schematic! Pressing OK

here will cause the symbol cache library to be saved into a special `rescue` library and all the symbols are renamed to avoid naming conflicts.

If you press Cancel, no rescues will be made, so KiCad will load all the new components by default. If you save the schematic at this point, your cache will be overwritten and the old symbols will not be recoverable. If you have saved the schematic, you can still go back and run the rescue function again by selecting "Rescue Cached Components" in the "Tools" menu to call up the rescue dialog again.

Чтобы этот диалог больше не отображался нужно нажать кнопку "Больше никогда не показывать". По умолчанию, ни какие действия не будут предприниматься и будут загружаться новые версии компонентов. Это поведение можно изменить (вернуть обратно) в диалоговом окне настроек библиотек.

Иерархические схемы

Введение

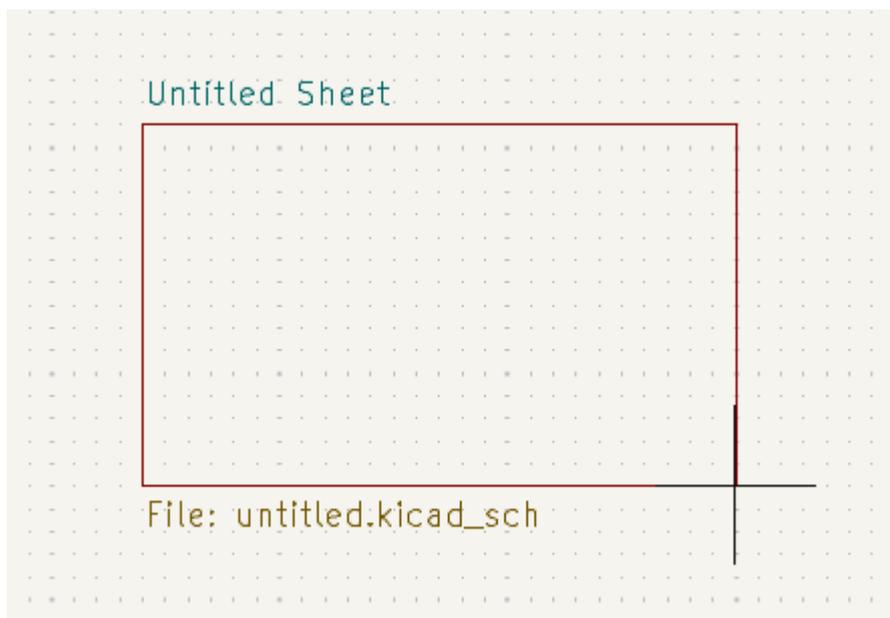

In KiCad, multi-sheet schematics are hierarchical: there is a single root sheet, and additional sheets are created as subsheets of either the root sheet or another subsheet. Sheets can be included in a hierarchy multiple times, if desired.

Carefully drawing a schematic as a hierarchical design improves schematic legibility and reduces repetitive drawing.

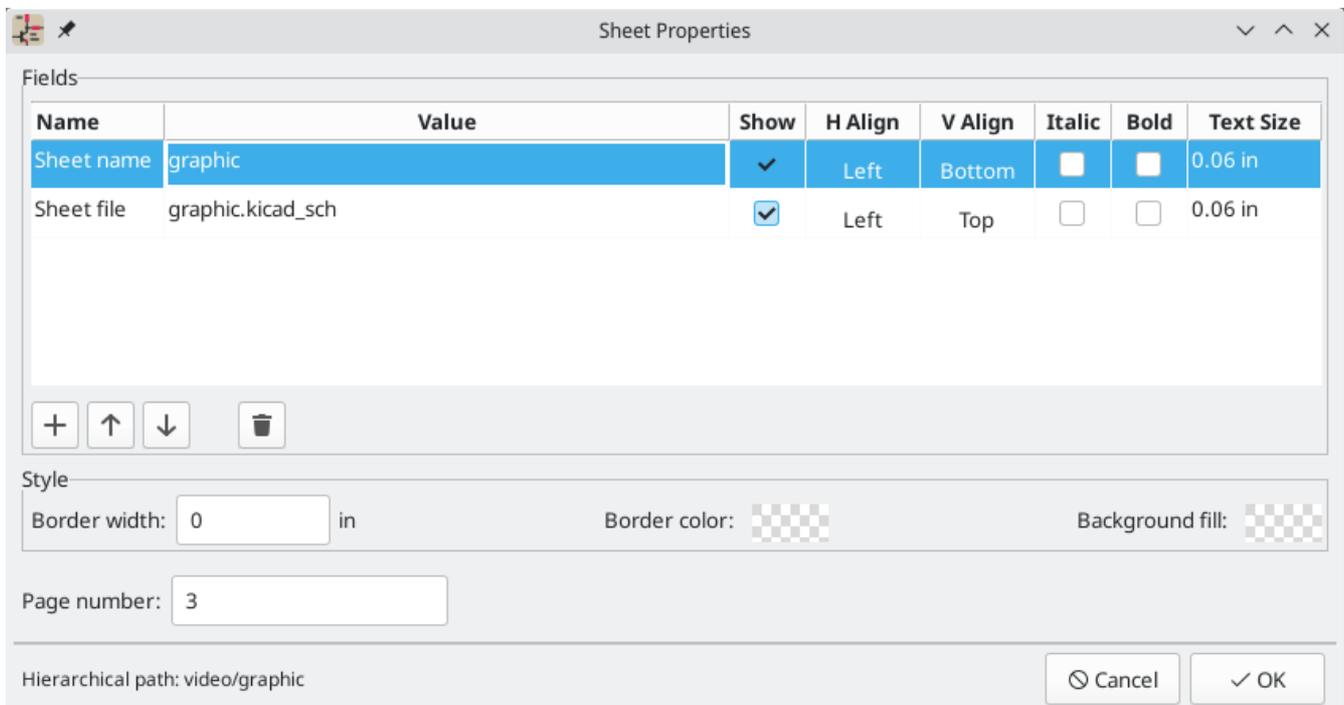

Creating a hierarchical schematic starts from the root sheet. The process is to create a subsheet, then draw the circuit in the subsheet and make the necessary electrical connections between sheets. Connections can be made between nets in a subsheet and nets in the parent sheet using hierarchical pins and labels, or between any two nets in the hierarchy using global labels.

Adding sheets to a design

You can add a subsheet to a design with the Add Hierarchical Sheet tool ( hotkey, or the  button in the right toolbar). Launch the tool, then click twice in the canvas to draw the upper left and lower right corners of the subsheet symbol. Make the sheet outline large enough to fit the [hierarchical pins you will add later](#).

The Sheet Properties dialog will appear and prompt you for a sheet name and filename.

The **sheet name** must be unique, as it is used in the full net name for any nets in the subsheet. For example, a net with the local label `net1` in the sheet `sheet1` would have a full net name of `/sheet1/net1`. The sheet name is also used to refer to the sheet in various places in the GUI, including the [title block](#) and the [hierarchy navigator](#).

The **sheet filename** specifies the file that the new sheet will be saved to or loaded from. A single sheet file can be used more than once in a project; the circuit drawn in the sheet will be instantiated once per usage. The same filename will be reused for each instantiation. The path to the sheet file can be relative or absolute. It is usually preferable to save subsheet files in the project directory and use a relative path so that the project is portable.

NOTE

Sheet files can be shared between multiple projects to allow design reuse between projects. However, this is not recommended due to path portability concerns and the risk of unintentionally changing other projects while editing a shared sheet.

The sheet's **page number** is configurable here. The page number is displayed in the sheet [title block](#) and the [hierarchy navigator](#), and sheets are sorted by page number in the hierarchy navigator and when [printing or plotting](#).

Several graphical options are also available. **Border width** sets the width of the border around the sheet shape. **Border color** and **Background fill** set the color for the border and fill of the sheet shape, respectively. If no color is set, a checkerboard swatch is shown and the default values from the color theme are used.

The Sheet Properties dialog can be accessed at any time by selecting a sheet and using the **E** hotkey, or with **Properties...** in the right-click context menu.

Navigating between sheets

You can enter a hierarchical sheet from the parent sheet by double-clicking the child sheet's shape, or right-clicking the child sheet and selecting **Enter Sheet**.

Return to the parent sheet by using the  button in the top toolbar, or by right-clicking in an empty part of the schematic and clicking **Leave Sheet**.

Alternatively, you can jump to any sheet with the hierarchy navigator. To open the hierarchy navigator, click the  button in the top toolbar. Each sheet in the design is displayed as an item in the tree. Clicking a sheet name opens that sheet in the editing canvas.

By default, the hierarchy navigator closes after a new sheet is opened. It can be configured to always remain open by selecting the **Keep hierarchy navigator open** option in the Editing Options section of the Schematic Editor preferences.

Electrical connections between sheets

Label overview

Electrical connections between sheets are made with [labels](#). There are several kinds of labels in KiCad, each with a different connection scope.

- **Local labels** only make connections within a sheet. Therefore local labels cannot be used to connect between sheets. Local labels are added with the  button.
- **Global labels** make connections anywhere in a schematic, regardless of sheet. Global labels are added with the  button.
- **Hierarchical labels** connect to **hierarchical sheet pins** accessible in the parent sheet. Hierarchical designs rely on hierarchical labels and pins to make connections between parent sheets and child sheets; you can think of hierarchical pins as defining the interface for a sheet. Hierarchical labels are added with the  button.

NOTE Labels that have the same name will connect, regardless of the label type, if they are in the same sheet.

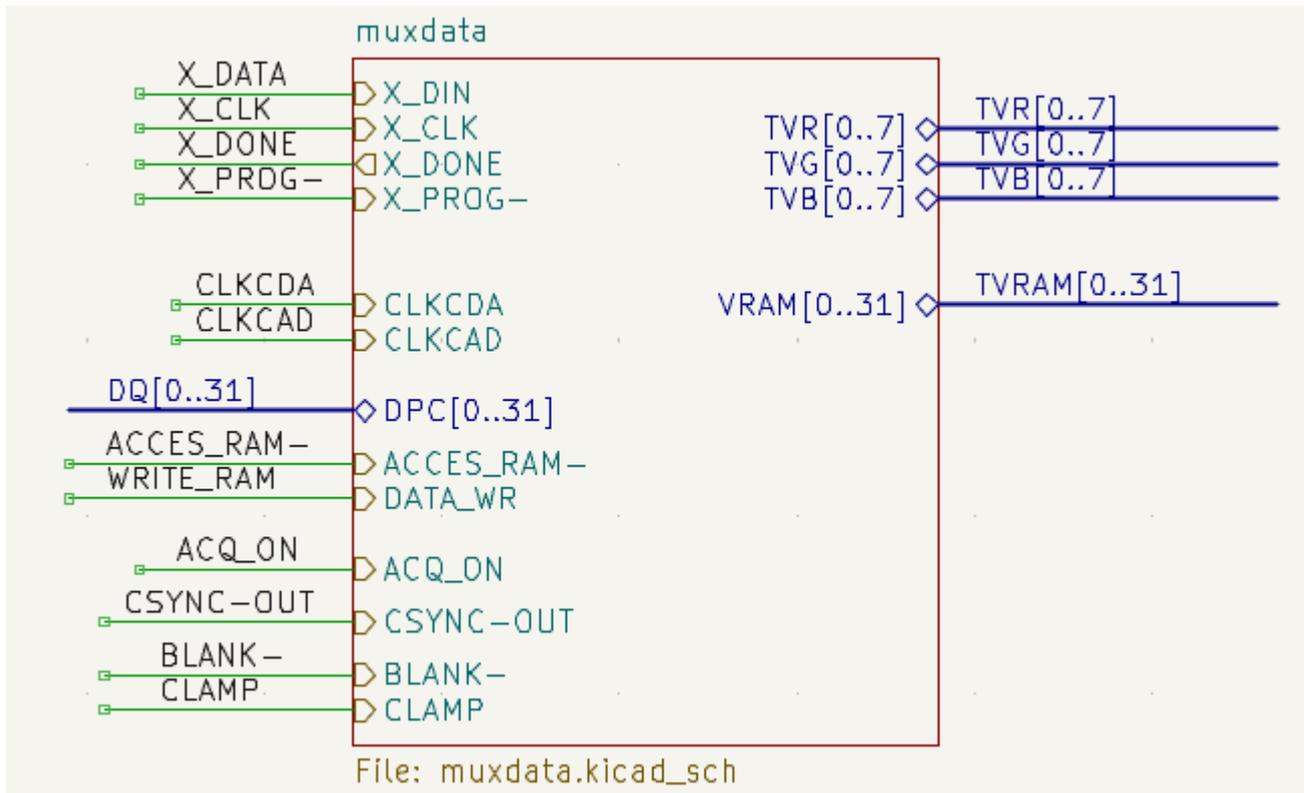

NOTE [Hidden power pins](#) can also be considered global labels, because they connect anywhere in the schematic hierarchy.

Hierarchical sheet pins

After placing hierarchical labels within the subsheet, matching **hierarchical pins** can be added to the subsheet symbol in the parent sheet. You can then make connections to the hierarchical pins with wires, labels, and buses. Hierarchical pins in a subsheet symbol are connected to the matching hierarchical labels in the subsheet itself.

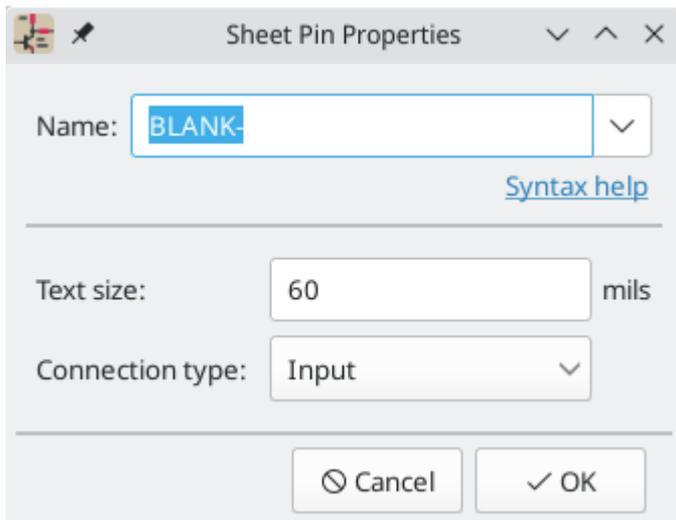

NOTE

Hierarchical labels must be defined in the subsheet before the corresponding hierarchical sheet pin can be imported in the sheet symbol.

For every hierarchical label in the subsheet, import the corresponding hierarchical pin into the sheet symbol by clicking the  button in the right toolbar, then clicking on the sheet symbol. A sheet pin for the first unmatched hierarchical label will be attached to the cursor, where it can be placed anywhere along the border of the sheet symbol. Clicking again with the tool will continue to import additional sheet pins until there are no more hierarchical pins to import from the subsheet. Sheet pins can also be imported by selecting **Import Sheet Pin** in a sheet symbol's right-click context menu.

You can edit the properties of a sheet pin in the Sheet Pin Properties dialog. Open this dialog by double-clicking a sheet pin, selecting a sheet pin and using the  hotkey, or right-clicking a sheet pin and selecting **Properties....**

The sheet pin's **name** can be edited in the textbox or by selecting from the dropdown list of hierarchical labels in the subsheet. A sheet pin's name has to match the corresponding hierarchical label in the subsheet, so if a pin name is changed the label must change as well.

The **connection type** changes the shape of the sheet pin, and has no electrical effect. It can be set to Input, Output, Bidirectional, Tri-state, or Passive. The pin's **text size** can also be changed.

Hierarchical design examples

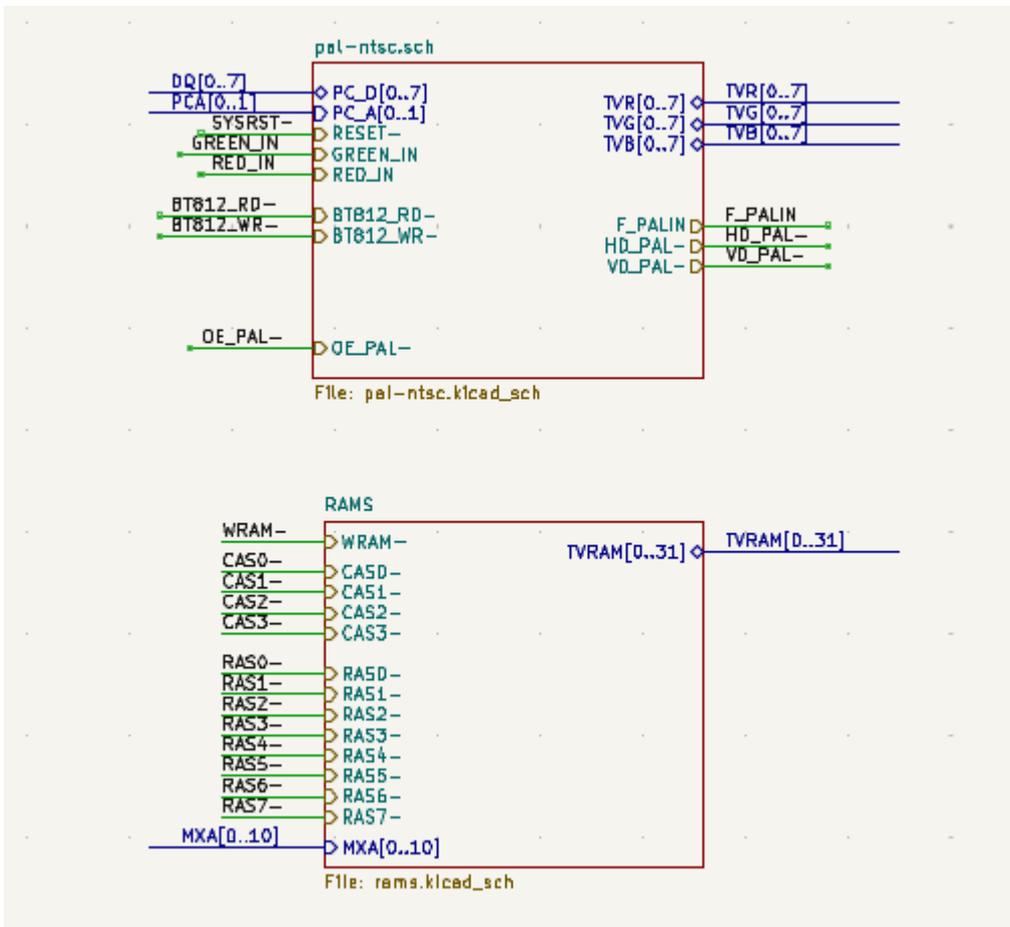

Hierarchical designs can be put into one of several categories:

- **Simple:** each sheet is used only once.
- **Complex:** some sheets are instantiated multiple times.
- **Flat:** a sub-case of a **simple** hierarchy, without connections between subsheets and their parent. Flat hierarchies can be used to represent a non-hierarchical design.

Each hierarchy model can be useful; the most appropriate one depends on the design.

Simple hierarchy

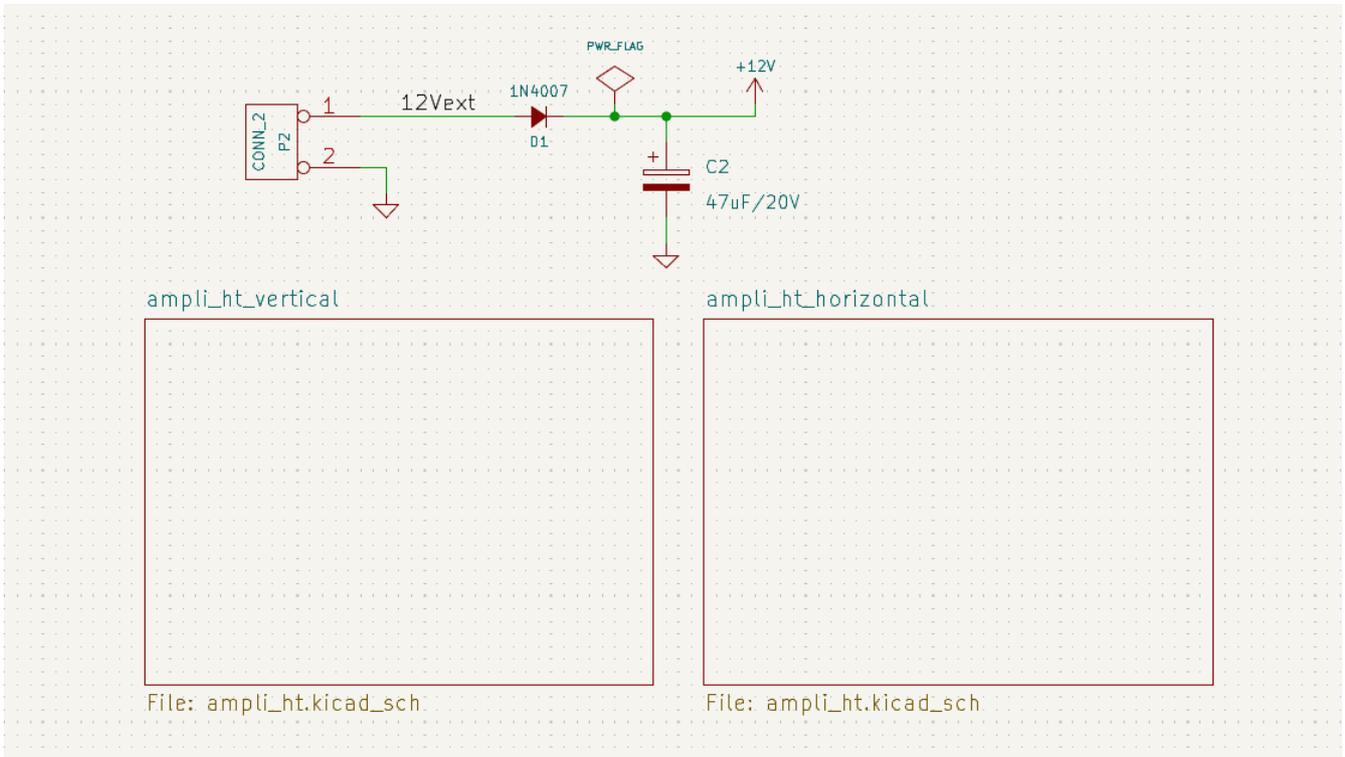

An example of a simple hierarchy is the [video](#) demo project included with KiCad. The root sheet contains seven unique subsheets, each with hierarchical labels and sheet pins linking the sheets to each other in the root sheet. Two of the subsheet symbols are shown below.

Сложные иерархии

The `complex_hierarchy` demo project is an example of a complex hierarchy. The root sheet contains two subsheet symbols, which both refer to the same sheet file (`ampli_ht.kicad_sch`). This allows the design to include two copies of the same amplifier circuit. Although the two sheet symbols refer to the same filename, the sheet names are unique (`ampli_ht_vertical` and `ampli_ht_horizontal`). Inside each subsheet the circuits are identical except for the reference designators, which as always are unique.

This project contains no sheet pin connections. The only connections between the root sheet and the subsheets are global power connections made with [power port symbols](#). However, sheets in a complex hierarchy could include sheet pin connections if appropriate for the design.

Плоские иерархии

The `flat_hierarchy` demo project is an example of a flat hierarchy. The root sheet contains two unique subsheet symbols with no hierarchical sheet pins. The root sheet in this project does nothing except hold the subsheets, and the subsheets are used only as additional pages in the schematic.

NOTE | This is the simplest way to create multi-page schematics in KiCad.

Inspecting a schematic

Find tool

The Find tool searches for text in the schematic, including reference designators, pin names, symbol fields, and graphic text. When the tool finds a match, the canvas is zoomed and centered on the match and the text is highlighted. Launch the tool using the  button in the top toolbar.

The Find tool has several options:

Match case: Selects whether the search is case-sensitive.

Words: When selected, the search will only match the search term with complete words in the schematic. When unselected, the search will match if the search term is part of a larger word in the schematic.

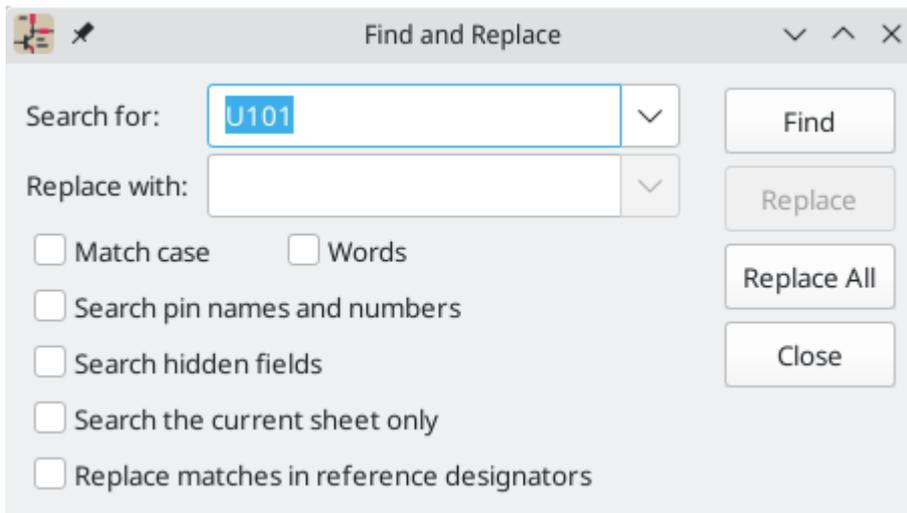

Wildcards: When selected, wildcards can be used in the search terms. `?` matches any single character, and `*` matches any number of characters. Note that when this option is selected, partial matches are not returned: searching for `abc*` will match the string `abcd`, but searching for `abc` will not.

Search pin names and numbers: Selects whether the search should apply to pin names and numbers.

Search hidden fields: Selects whether the search should apply only to visible fields or if it should include hidden symbol fields.

Search the current sheet only: Selects whether the search should be limited to the current schematic sheet or to the entire schematic.

There is also a Find and Replace tool which is activated with the  button in the top toolbar. This tool behaves the same as the Find tool, but additionally can replace some or all matches with different text.

If the **Replace matches in reference designators** option is checked, reference designators will be modified if they contain matching text. Otherwise reference designators will not be affected.

Net highlighting

An electrical net can be highlighted in the schematic editor to visualize all of the places it appears in the schematic. Net highlighting can be activated in the Schematic Editor or by highlighting the corresponding net in the PCB editor when cross-probe highlighting is enabled (see below). When net highlighting is active, the highlighted net will be shown in a different color. By default this color is pink, but it is configurable in the Color section of the Preferences dialog.

Nets can be highlighted by clicking on a wire or pin using the Highlight Net tool in the right toolbar () . Alternatively, the Highlight Net hotkey () highlights the net under the cursor. If there are no nets or pins under the cursor, any existing highlighting will be cleared. The highlighting can also be cleared by using the Clear Net Highlight action (hotkey ) .

Cross-probing from the PCB

KiCad allows bi-directional cross-probing between the schematic and the PCB. There are several different types of cross-probing.

Selection cross-probing allows you to select a symbol or pin in the schematic to select the corresponding footprint or pad in the PCB (if one exists) and vice-versa. By default, cross-probing will result in the display centering on the cross-probed item and zooming to fit. This behavior can be disabled in the Display Options section of the Preferences dialog.

Highlight cross-probing allows you to highlight a net in the schematic and PCB at the same time. If the option "Highlight cross-probed nets" is enabled in the Display Options section of the Preferences dialog, highlighting a net or bus in the schematic editor will cause the corresponding net or nets to be highlighted in the PCB editor, and vice versa.

Проверка электрических правил проектирования

The Electrical Rules Check (ERC) tool performs an automatic check of your schematic. The ERC checks for any errors in your sheet, such as unconnected pins, unconnected hierarchical symbols, shorted outputs, etc. ERC output is reported as errors or warnings depending on the severity of the issue detected.

Naturally, an automatic check is not infallible, and it is not possible to detect all design errors. Such a check is still very useful, because it allows you to detect many oversights and small errors. All detected issues should be checked and addressed before proceeding.

The quality of the ERC is directly related to the care taken in declaring [electrical pin properties](#) during symbol library creation.

ERC can be started by clicking on the  button in the top toolbar and clicking the **Run ERC** button.

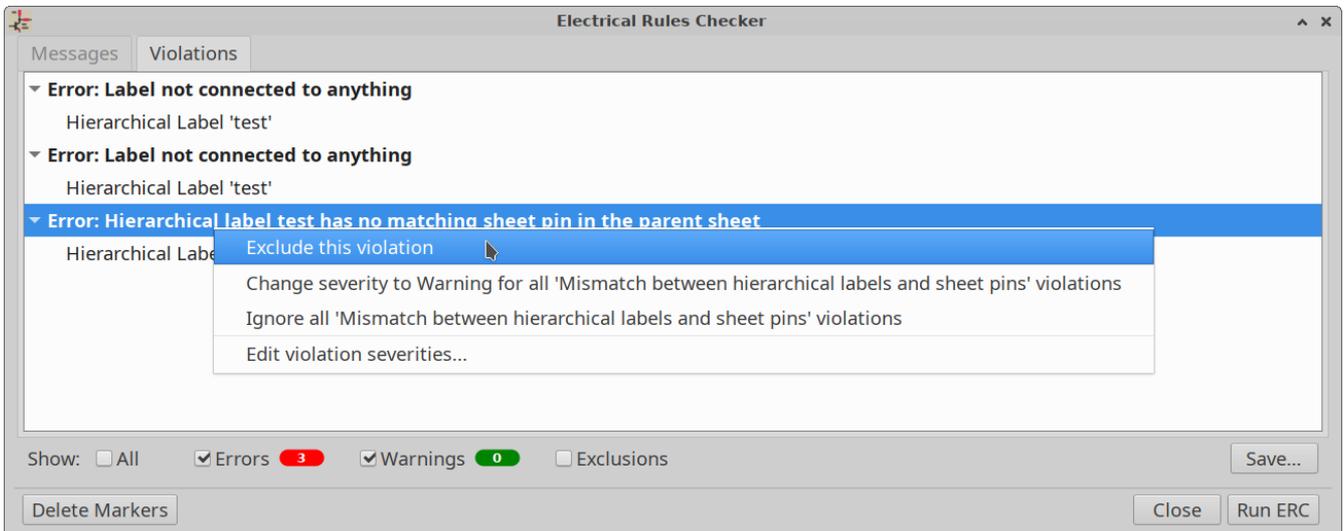

Any warnings or errors are reported in the **Violations** tab, and markers for each violation are placed in the schematic so that they point to the relevant part of the schematic. Warnings are indicated by yellow arrows, and errors have red arrows. Excluded violations are shown as green arrows.

NOTE

Selecting a violation in the ERC window jumps to the selected violation marker in the schematic.

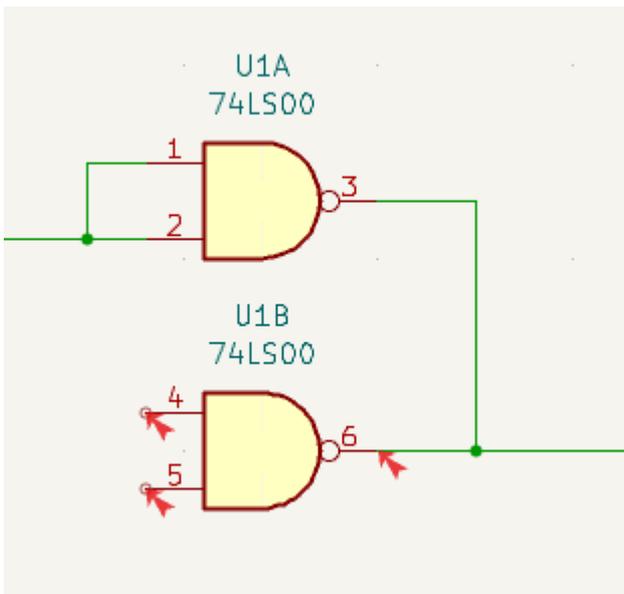

The numbers at the bottom of the window show the number of errors, warnings, and exclusions. Each type of violation can be filtered from the list using the respective checkboxes. Clicking **Delete Markers** will clear all violations until ERC is run again.

Violations can be right-clicked in the dialog to ignore them or change their severity:

- **Exclude this violation:** ignores this particular violation, but does not affect any other violations.
- **Change severity:** changes a type of violation from warning to error, or error to warning. This affects all violations of a given type.
- **Ignore all:** ignores all violations of a given type.

ERC example

Here you can see three errors:

- Two outputs have been connected together (red arrow at right).
- Two inputs have been left unconnected (red arrows at left).

Selecting an ERC marker displays a description of the violation in the message pane at the bottom of the window.

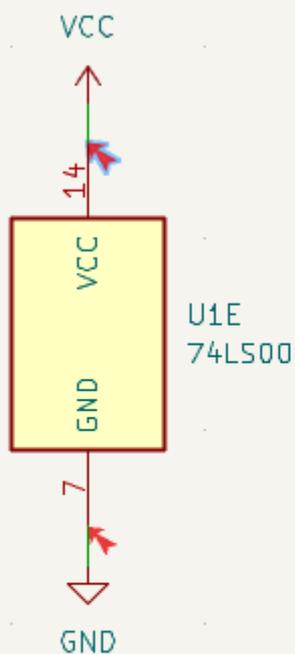

Power pins and power flags

It is common to have an "Input Power pin not driven by any Output Power pins" error on power pins, as shown in the example below, even though the power pins seem to be properly connected to a power rail. This happens in designs where the power is provided through connectors or other components that are not marked as In these cases ERC won't detect any Output Power pins connected to the net and will determine the Input Power pin is not driven by a power source.

Electrical Rule Check Error
Input Power pin not driven by any Output Power pins

To avoid this warning, connect the net to `PWR_FLAG` symbol on such a power net as shown in the following example. The `PWR_FLAG` symbol is found in the `power` symbol library. Alternatively, connect any power output pin to the net; `PWR_FLAG` is simply a symbol with a single power output pin.

Electrical Rule Check Error
Input Power pin not driven by any Output Power pins

Ground nets often need a `PWR_FLAG` as well, because voltage regulators have outputs declared as power outputs, but their ground pins are typically marked as power inputs. Therefore grounds can appear unconnected to a source unless a `PWR_FLAG` symbol is used.

For more information about power pins and power flags, see the [PWR_FLAG documentation](#).

ERC Configuration

The *Pin Conflicts Map* panel in [Schematic Setup](#) allows you to configure connectivity rules to define electrical conditions for errors and warnings based on what types of pins are connected to each other.

Правила настраиваются путём нажатия левой кнопки мыши на квадратах матрицы, циклически перебирая варианты: нормально, предупреждение, ошибка.

The *Violation Severity* panel in [Schematic Setup](#) lets you configure what types of ERC messages should be reported as Errors, Warnings or ignored.

Отчёт проверки правил

An ERC report file can be generated and saved by clicking the **Save...** button in the ERC dialog. The file extension for ERC report files is `.rpt`. Here is an example ERC report file.

```
ERC report (Fri 21 Oct 2022 02:07:05 PM EDT, Encoding UTF8)

***** Sheet /
[pin_not_driven]: Input pin not driven by any Output pins
; Severity: error
@(149.86 mm, 60.96 mm): Symbol U1B [74LS00] Pin 4 [, Input, Line]
[pin_not_connected]: Pin not connected
; Severity: error
@(149.86 mm, 60.96 mm): Symbol U1B [74LS00] Pin 4 [, Input, Line]
[pin_not_connected]: Pin not connected
; Severity: error
@(149.86 mm, 66.04 mm): Symbol U1B [74LS00] Pin 5 [, Input, Line]
[pin_to_pin]: Pins of type Output and Output are connected
; Severity: error
@(165.10 mm, 63.50 mm): Symbol U1B [74LS00] Pin 6 [, Output, Inverted]
@(165.10 mm, 46.99 mm): Symbol U1A [74LS00] Pin 3 [, Output, Inverted]
[pin_not_driven]: Input pin not driven by any Output pins
; Severity: error
@(149.86 mm, 66.04 mm): Symbol U1B [74LS00] Pin 5 [, Input, Line]

** ERC messages: 5 Errors 5 Warnings 0
```

Assigning Footprints

Before routing a PCB, footprints need to be selected for every component that will be assembled on the board. Footprints define the copper connections between physical components and the routed traces on a circuit board.

Some symbols come with footprints pre-assigned, but for many symbols there are multiple possible footprints, so the user needs to select the appropriate one.

KiCad offers several ways to assign footprints:

- СВОЙСТВА КОМПОНЕНТА
 - Symbol Properties Dialog
 - Symbol Fields Table
- While placing symbols
- Footprint Assignment Tool

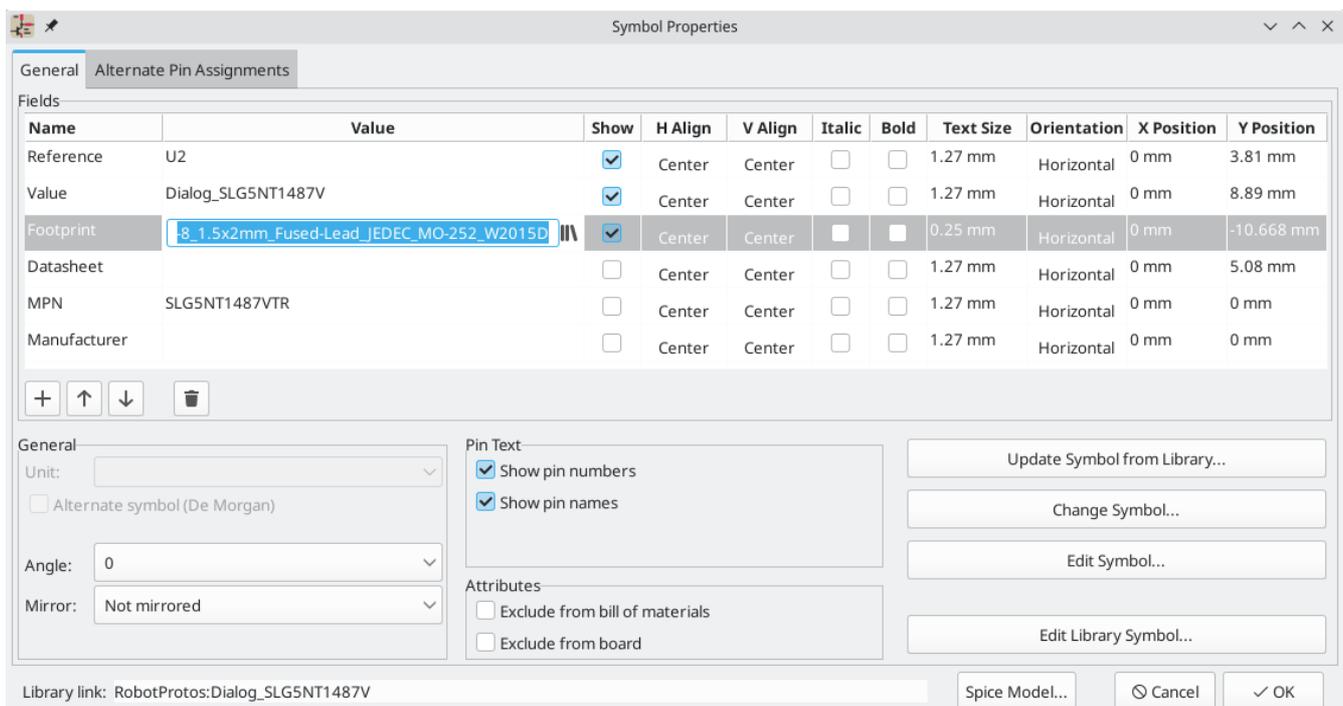

Each method will be explained below. Which to use is a matter of preference; one method may be more convenient depending on the situation. All of these methods are equivalent in that they store the name of the selected footprint in the symbol's `Footprint` field.

NOTE

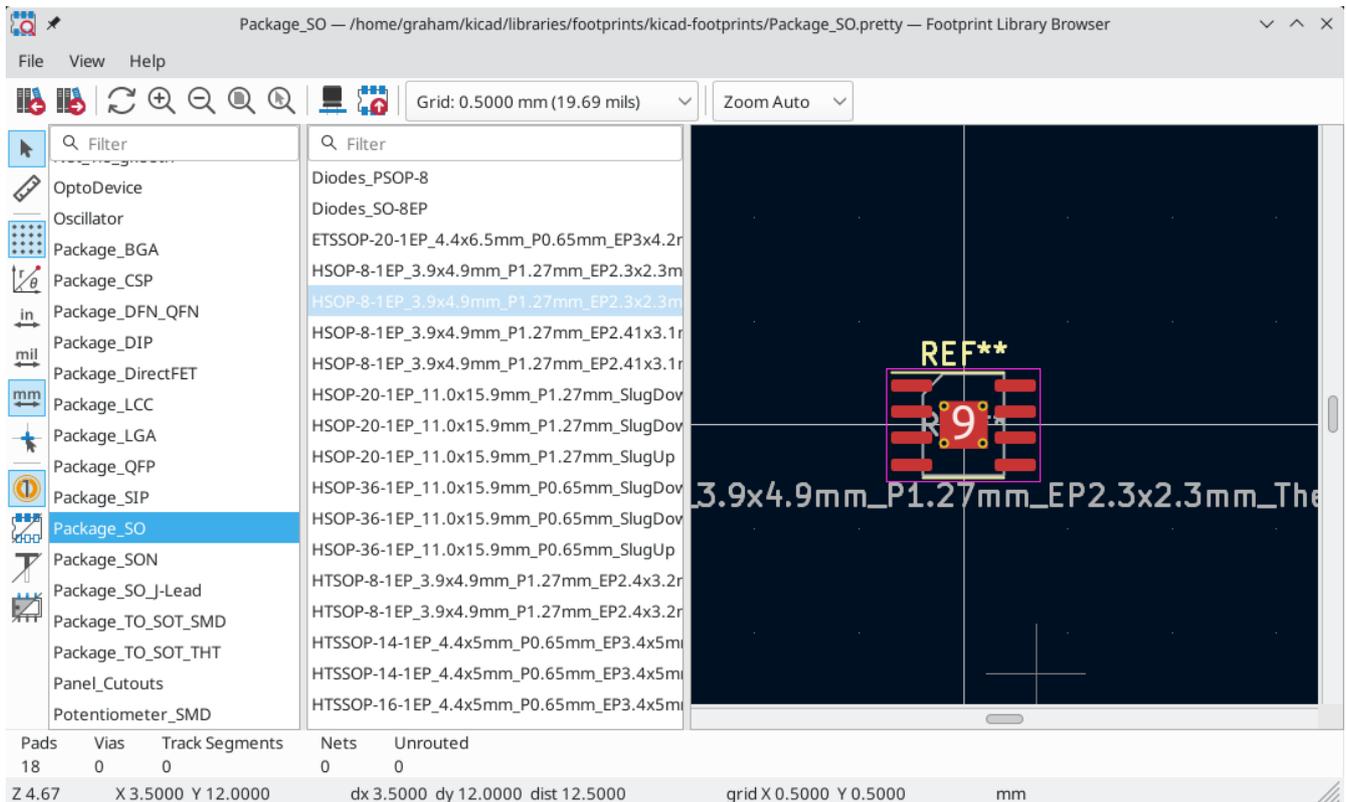

The Footprint Library Table needs to be configured before footprints can be assigned. For information on configuring the Footprint Library Table, please see the [PCB Editor manual](#).

Assigning Footprints in Symbol Properties

A symbol's `Footprint` field can be edited directly in the symbol's Properties window.

Clicking the  button in the Footprint field opens the Footprint Library Browser, which shows the available footprints and footprint libraries. Single clicking a footprint name selects the footprint and displays it in the preview pane on the right, while double clicking on a footprint closes the browser and sets the symbol's Footprint field to the selected footprint.

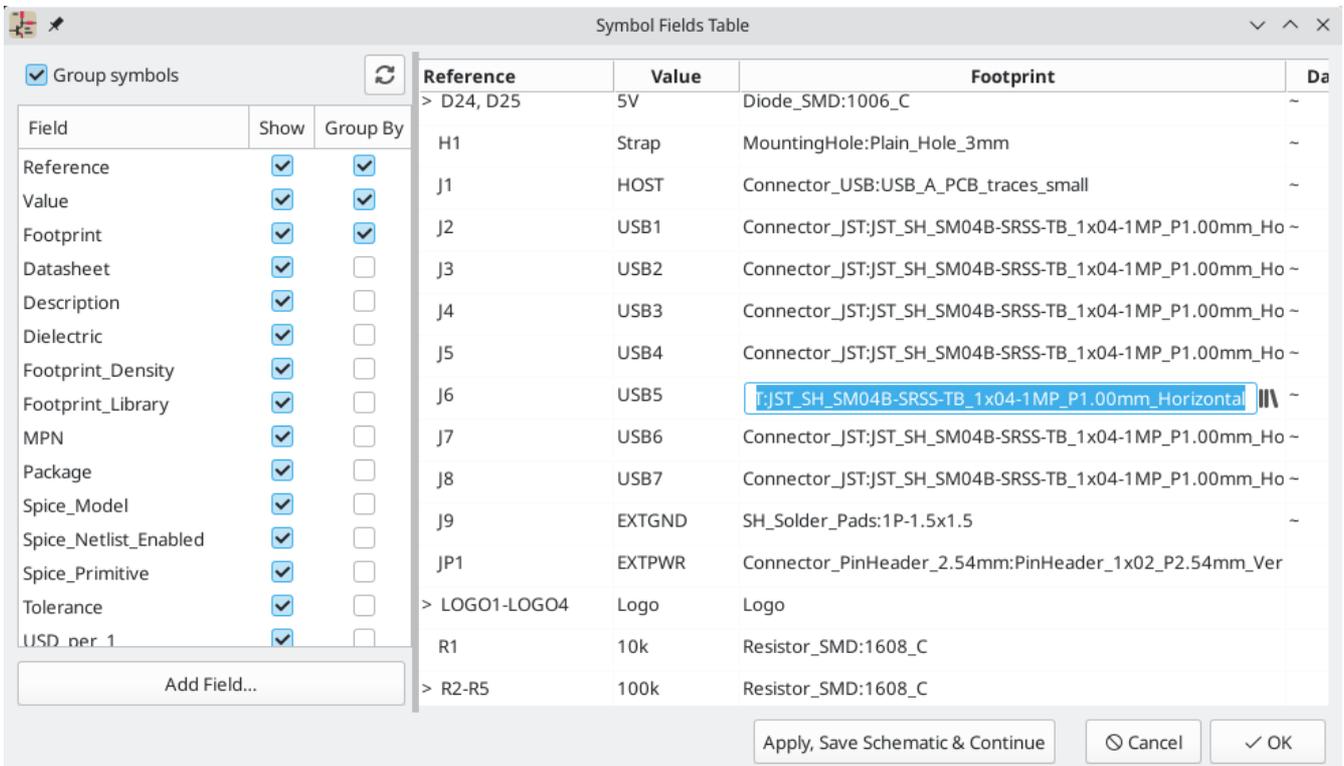

Assigning Footprints with the Symbol Fields Table

Rather than editing the properties of each symbol individually, the Symbol Fields Table can be used to view and edit the properties of all symbols in the design in one place. This includes assigning footprints by editing the Footprint field of each symbol.

The Symbol Fields Table is accessed with **Tools** → **Edit Symbol Fields...**, or with the  button on the top toolbar.

The Footprint field behaves the same here as in the Symbol Properties window: it can be edited directly, or footprints can be selected visually with the Footprint Library Browser.

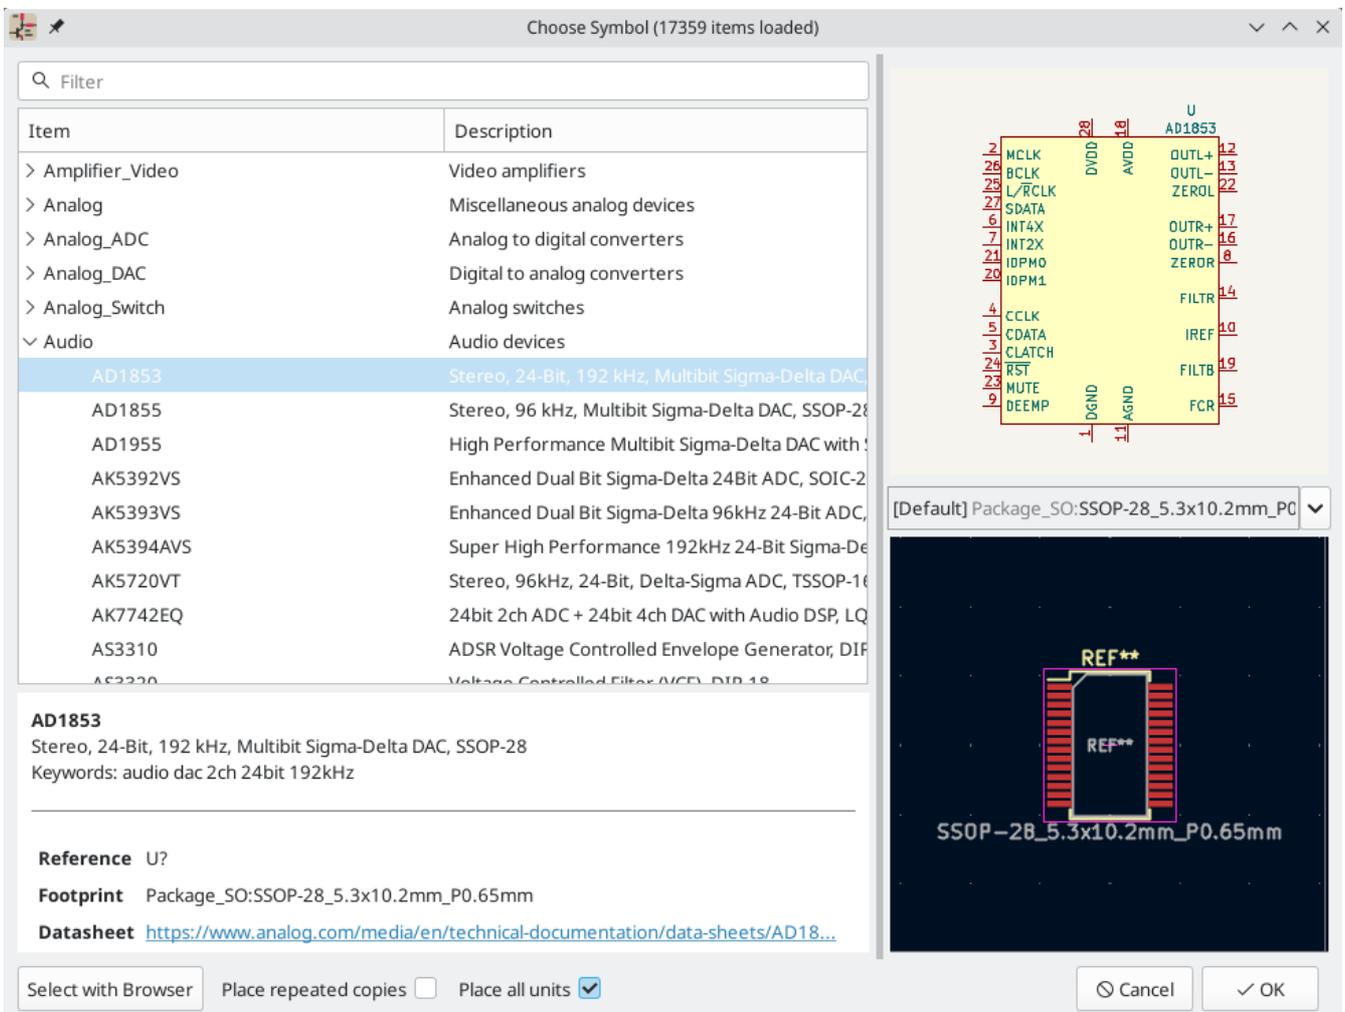

For more information on the Symbol Fields Table, see the [section on editing symbol properties](#).

Assigning Footprints While Placing Symbols

Footprints can be assigned to symbols when the symbol is first added to the schematic.

Some symbols are defined with a default footprint. These symbols will have this footprint preassigned when they are added to the schematic. The default footprint is shown in the Add Symbol dialog. For symbols without a default symbol defined, the footprint dropdown will say "No default footprint", and the footprint preview canvas will say "No footprint specified".

Symbols can have footprint filters that specify which footprints are appropriate to use with that symbol. If footprint filters are defined for the selected symbol, all footprints that match the footprint filters will appear as options in the footprint dropdown. The selected footprint will be displayed in the preview canvas and will be assigned to the symbol when the symbol is added to the schematic.

NOTE

Footprint options will not appear in the footprint dropdown unless the footprint libraries are loaded. Footprint libraries are loaded the first time the Footprint Editor or Footprint Library Browser are opened in a session.

For more information on footprint filters, see the [Symbol Editor Documentation](#).

Assigning Footprints with the Footprint Assignment Tool

The Footprint Assignment Tool allows you to associate symbols in your schematic to footprints used when laying out the printed circuit board. It provides footprint list filtering, footprint viewing, and 3D component model viewing to help ensure the correct footprint is associated with each component.

Components can be assigned to their corresponding footprints manually or automatically by creating equivalence files (.equ files). Equivalence files are lookup tables associating each component with its footprint.

Run the tool with **Tools** → **Assign Footprints...**, or by clicking the  icon in the top toolbar.

Footprint Assignment Tool Overview

The image below shows the main window of the Footprint Assignment Tool.

- The left pane contains the list of available footprint libraries associated with the project.
- The center pane contains the list of symbols in the schematic.
- The right pane contains the list of available footprints loaded from the project footprint libraries.
- The bottom pane describes the filters that have been applied to the footprint list and prints information about the footprint selected in the rightmost pane.

The top toolbar contains the following commands:

| | |
|--|--|
|  | Transfer the current footprint associations to the schematic. |
|  | Edit the global and project footprint library tables. |
|  | View the selected footprint in the footprint viewer. |
|  | Select the previous symbol without a footprint association. |
|  | Select the next symbol without a footprint association. |
|  | Undo last edit. |
|  | Redo last edit. |
|  | Perform automatic footprint association using an equivalence file. |
|  | Delete all footprint assignments. |
|  | Filter footprint list by footprint filters defined in the selected symbol. |
|  | Filter footprint list by pin count of the selected symbol. |
|  | Filter footprint list by selected library. |

The following table lists the keyboard commands for the Footprint Assignment Tool:

| | |
|-------------------|--|
| Right Arrow / Tab | Activate the pane to the right of the currently activated pane. Wrap around to the first pane if the last pane is currently activated. |
| Left Arrow | Activate the pane to the left of the currently activated pane. Wrap around to the last pane if the first pane is currently activated. |
| Up Arrow | Select the previous item of the currently selected list. |
| Down Arrow | Select the next item of the currently selected list. |
| Page Up | Select the item one full page upwards of the currently selected item. |
| Page Down | Select the item one full page downwards of the currently selected item. |
| Home | Select the first item of the currently selected list. |
| End | Select the last item of the currently selected list. |

Manually Assigning Footprints with the Footprint Assignment Tool

To manually associate a footprint with a component, first select a component in the component (middle) pane. Then select a footprint in the footprint (right) pane by double-clicking on the name of the desired

footprint. The footprint will be assigned to the selected component, and the next component without an assigned footprint is automatically selected.

NOTE

If no footprints appear in the footprint pane, check that the [footprint filter options](#) are correctly applied.

When all components have footprints assigned to them, click the **OK** button to save the assignments and exit the tool. Alternatively, click **Cancel** to discard the updated assignments, or **Apply, Save Schematic & Continue** to save the new assignments without exiting the tool.

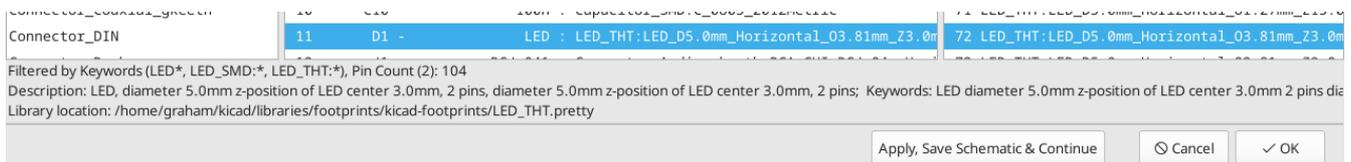

Фильтрация списка посадочных мест

There are four filtering options which restrict which footprints are displayed in the footprint pane. The filtering options are enabled and disabled with three buttons and a textbox in the top toolbar.

- : Activate [filters that can be defined in each symbol](#). For example, an opamp symbol might define filters that show only SOIC and DIP footprints.
- : Only show footprints that match the selected symbol's pin count.
- : Only show footprints from the library selected in the left pane.
- Entering text in the textbox hides footprints that do not match the text. This filter is disabled when the box is empty.

When all filters are disabled, the full footprint list is shown.

The applied filters are described in the bottom pane of the window, along with the number of footprints that meet the selected filters. For example, when the symbol's footprint filters and pin count filters are enabled, the bottom pane prints the footprint filters and pin count:

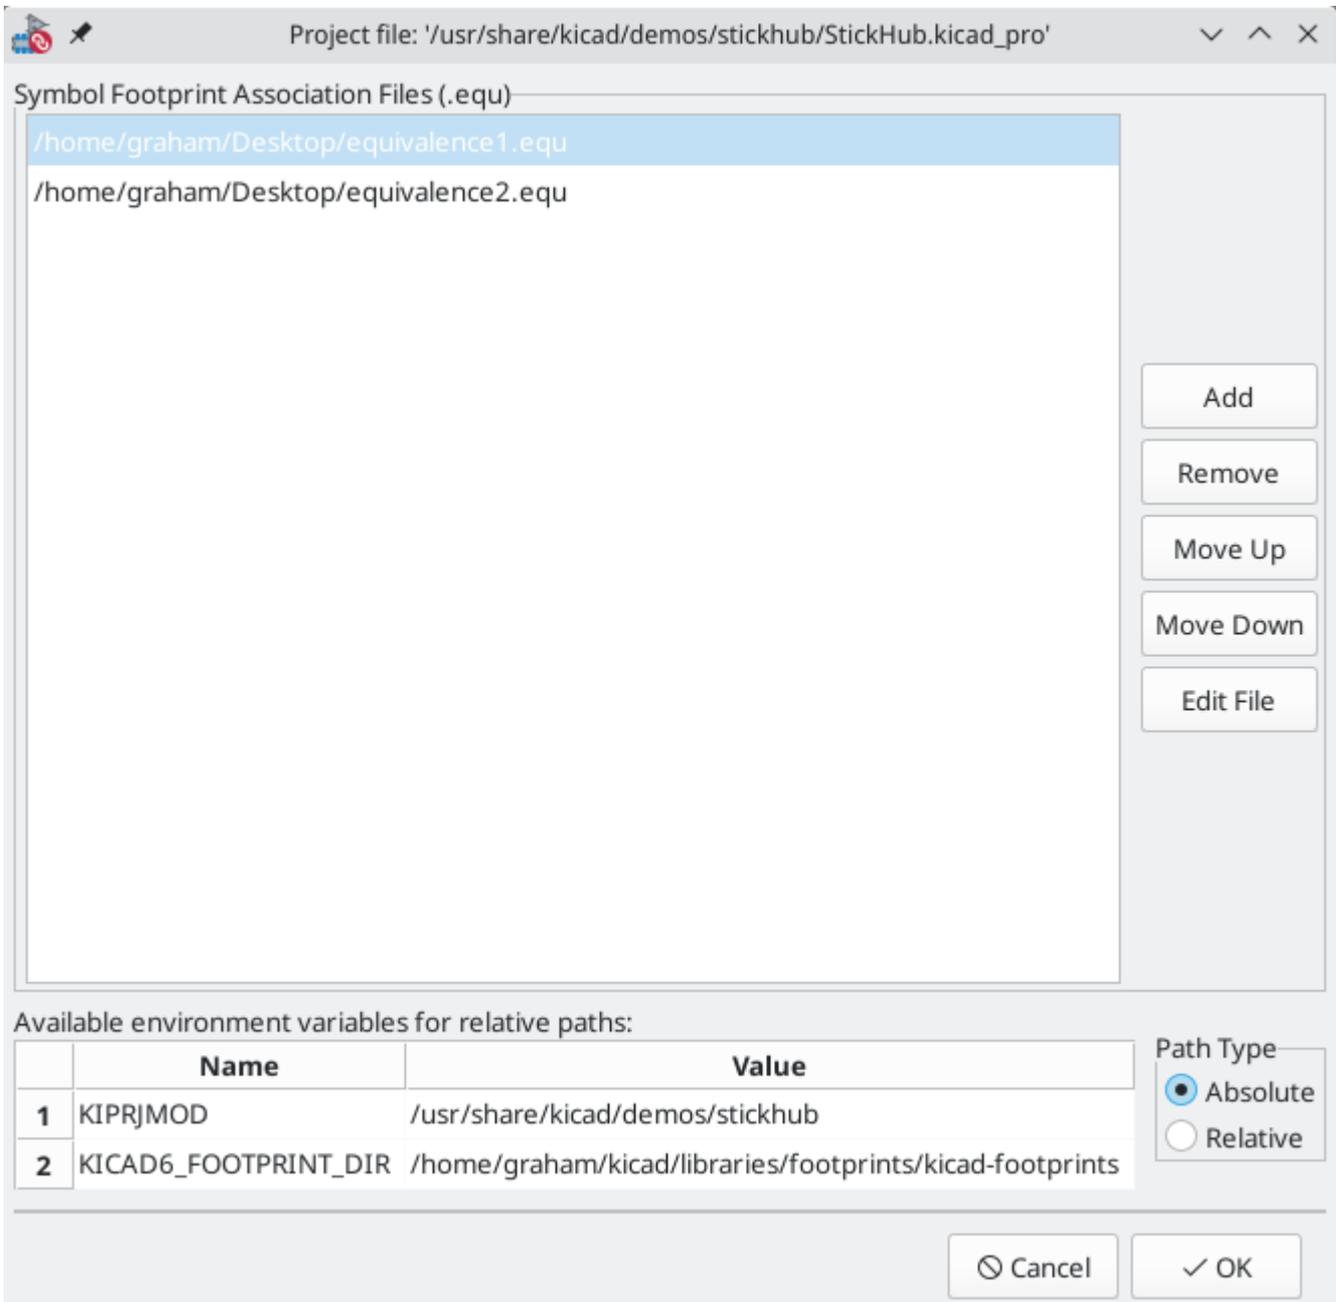

Multiple filters can be used at once to help narrow down the list of possibly appropriate footprints in the footprint pane. The symbols in KiCad's standard library define footprint filters that are designed to be used in combination with the pin count filter.

Automatically Assigning Footprints with the Footprint Assignment Tool

The Footprint Assignment Tool allows you to store footprint assignments in an external file and load the assignments later, even in a different project. This allows you to automatically associate symbols with the appropriate footprints.

The external file is referred to as an equivalence file, and it stores a mapping of a symbol value to a corresponding footprint. Equivalence files typically use the `.equ` file extension. Equivalence files are plain text files with a simple syntax, and must be created by the user using a text editor. The syntax is described below.

You can select which equivalence files to use by clicking **Preferences** → **Manage Footprint Association Files** in the Footprint Assignment Tool.

- Add new equivalence files by clicking the **Add** button.
- Remove the selected equivalence file by clicking the **Remove** button.
- Change the priority of equivalence files by clicking the **Move Up** and **Move Down** buttons. If a symbol's value is found in multiple equivalence files, the footprint from the last matching equivalence file will override earlier equivalence files.
- Open the selected equivalence file by clicking the **Edit File** button.

Relevant environment variables are shown at the bottom of the window. When the **Relative** path option is checked, these environment variables will automatically be used to make paths to selected equivalence files relative to the project or footprint libraries.

Once the desired equivalence files have been loaded in the correct order, automatic footprint association can be performed by clicking the  button in the top toolbar of the Footprint Assignment Tool.

All symbols with a value found in a loaded equivalence file will have their footprints automatically assigned. However, symbols that already have footprints assigned will not be updated.

Формат файлов эквивалентности

Equivalence files consist of one line for each symbol value. Each line has the following structure:

```
'<symbol value>' '<footprint library>:<footprint name>'
```

Each name/value must be surrounded by single quotes (') and separated by one or more spaces. Lines starting with # are comments.

For example, if you want all symbols with the value LM4562 to be assigned the footprint Package_SO:SOIC-8_3.9x4.9_P1.27mm, the line in the equivalence file should be:

```
'LM4562' 'Package_SO:SOIC-8_3.9x4.9_P1.27mm'
```

Здесь приведён пример файла эквивалентности:

```
#regulators 'LP2985LV' 'Package_TO_SOT_SMD:SOT-23-5_HandSoldering' ``
```

```
==== Просмотр посадочного места
```

The Footprint Assignment Tool contains a footprint viewer. Clicking the image:images/icons/icon_footprint_browser_24.png[footprint viewer icon] button in the top toolbar launches the footprint viewer and shows the selected footprint.

```
image::images/ru/footprint_view.png[scaledwidth="90%", alt="Просмотр посадочного места"]
```

The top toolbar contains the following commands:

```
[width="90%", cols="10%,90%"]
|=====
|image:images/icons/refresh_24.png[]
|Refresh view
|image:images/icons/zoom_in_24.png[]
|Zoom in
|

DC 10 V3 GND VSS DC 10 .ac dec 10 1 1Meg .end
```

```
[[notes-on-netlists]]
```

```
==== Замечания о списках соединений
```

```
[[netlist-name-precautions]]
```

```
===== Предостережение об именовании элементов списка соединений
```

Many software tools that use netlists do not accept spaces in component names, pins, nets, or other fields. Avoid using spaces in pins, labels, names, and value fields of components to ensure maximum compatibility.

In the same way, special characters other than letters and numbers can cause problems. Note that this limitation is not related to KiCad, but to the netlist formats that can then become untranslatable by other software that reads those netlist files.

```
[[spice-netlists]]
```

```
===== Spice netlists
```

Spice simulators expect simulation commands (`.PROBE`, `.AC`, `.TRAN`, etc.) to be included in the netlist.

Any text line included in the schematic diagram starting with a period (`. `) will be included in the netlist. If a text object contains multiple lines, only the lines beginning with a period will be included.

``.include`` directives for including model library files are automatically added to the netlist based on the Spice model settings for the symbols in the schematic.

```
[[other-formats]]
==== Other netlist formats
```

KiCad supports custom netlist generators for exporting netlists in other formats. This process is explained in the <<custom-netlist-and-bom-formats,custom netlist generators section>>.

:experimental:

```
[[managing-symbol-libraries]]
== Managing Symbol Libraries
```

Библиотеки компонентов содержат наборы компонентов, используемые при создании схем. Каждый компонент схемы однозначно обозначен полным наименованием, которое состоит из уникального имени библиотеки и названия компонента. Например ``Audio:AD1853``.

```
=== Таблица библиотек компонентов
```

KiCad uses a table of symbol libraries to map symbol libraries to a library nickname. Kicad uses a global symbol library table as well as a table specific to each project. To edit either symbol library table, use `**Preferences** -> **Manage Symbol Libraries...**`.

```
image::images/ru/options_symbol_lib.png[scaledwidth="80%", alt="Диалоговое окно менеджера библиотек"]
```

The global symbol library table contains the list of libraries that are always available regardless of the currently loaded project. The table is saved in the file ``sym-lib-table`` in the KiCad configuration folder. `xref:../kicad/kicad.adoc#config-file-location`[The location of this folder] depends on the operating system being used.

The project specific symbol library table contains the list of libraries that are available specifically for the currently loaded project. If there are any project-specific symbol libraries, the table is saved in the file ``sym-lib-table`` in the project folder.

```
==== Начальная настройка
```

The first time the KiCad Schematic Editor is run and the global symbol table file ``sym-lib-table`` is not found in the KiCad configuration folder, KiCad will guide the user through setting up a new symbol library table. This process is described <<initial-configuration,above>>.

```
==== Managing Table Entries
```

Symbol libraries can only be used if they have been added to either the global or project-specific symbol library table.

Add a library either by clicking the `image:images/icons/small_folder_16.png`[Folder icon] button and selecting a library or clicking the `image:images/icons/small_plus_16.png`[Plus icon] button and typing the path to a library file. The selected library will be added to the currently opened library table (Global or Project Specific). Libraries can be removed by selecting desired library entries and clicking the `image:images/icons/small_trash_16.png`[Delete icon] button.

The `image:images/icons/small_up_16.png`[Up icon] and `image:images/icons/small_down_16.png`[Down icon] buttons move the selected library up and down in the library table. This does not affect the display order of libraries in the Symbol Library Browser, Symbol Editor, or Add Symbol tool.

Libraries can be made inactive by unchecking the **Active** checkbox in the first column. Inactive libraries are still in the library table but do not appear in any library browsers and are not loaded from disk, which can reduce loading times.

A range of libraries can be selected by clicking the first library in the range and then `kbd:[Shift]`-clicking the last library in the range.

Each library must have a unique nickname: duplicate library nicknames are not allowed in the same table. However, nicknames can be duplicated between the global and project library tables. Libraries in the project table take precedence over libraries with the same name in the global table.

Library nicknames do not have to be related to the library filename or path. The colon character (``:``) cannot be used in library nicknames or symbol names because it is used as a separator between nicknames and symbols.

Each library entry must have a valid path. Paths can be defined as absolute, relative, or by `<<environment-variable-substitution,environment variable substitution>>`.

The appropriate library format must be selected in order for the library to be properly read. "KiCad" format is used for KiCad version 6 libraries (``.kicad_sym`` files), while "Legacy" format is used for libraries from older versions of KiCad (``.lib`` files). Legacy libraries are read-only, but can be migrated to KiCad format libraries using the ****Migrate Libraries**** button (see section `<<migrating-libraries,Migrating Legacy Libraries>>`).

There is an optional description field to add a description of the library entry. The option field is not used at this time so adding options will have no effect when loading libraries.

```
[[environment-variable-substitution]]
==== Подстановка переменных окружения
```

The symbol library tables support environment variable substitution, which allows you to define environment variables containing custom paths to where

your libraries are stored. Environment variable substitution is supported by using the syntax ``${ENV_VAR_NAME}`` in the symbol library path.

By default, KiCad defines several environment variables:

- * ``${KIPROJMOD}`` points to the current project directory and cannot be modified.
- * ``${KICAD6_FOOTPRINT_DIR}`` points to the default location of KiCad's standard footprint libraries.
- * ``${KICAD6_SYMBOL_DIR}`` points to the default location of KiCad's standard symbol libraries.
- * ``${KICAD6_3DMODEL_DIR}`` points to the default location of KiCad's standard 3D model libraries.
- * ``${KICAD6_TEMPLATE_DIR}`` points to the default location of KiCad's standard template library.

``${KIPROJMOD}`` cannot be redefined, but the other environment variables can be redefined and new environment variables added in the **Preferences** -> **Configure Paths...** dialog.

Using environment variables in the symbol library tables allows libraries to be relocated without breaking the symbol library tables, so long as the environment variables are updated when the library location changes.

``${KIPROJMOD}`` allows libraries to be stored in the project folder without having to use an absolute path in the project library table. This makes it possible to relocate projects without breaking their project library tables. One of the most powerful features of the symbol library table is environment variable substitution. This allows for definition of custom paths to where symbol libraries are stored in environment variables. Environment variable substitution is supported by using the syntax ``${ENV_VAR_NAME}`` in the library path.

==== Варианты использования

Symbol libraries can be defined either globally or specifically to the currently loaded project. Symbol libraries defined in the user's global table are always available and are stored in the ``sym-lib-table`` file in the user's KiCad configuration folder. The project-specific symbol library table is active only for the currently open project file.

При использовании каждой из таблиц имеются свои достоинства и недостатки. Если определить все библиотеки в общей таблице, то они будут доступны всегда и в любом проекте. Недостатком этого способа является увеличенное время загрузки.

Если же определить только необходимые библиотеки в таблице проекта, то это существенно снизит время загрузки. Недостатком этого способа является то, что нужно постоянно помнить перечень библиотек и добавлять нужные к каждому новому проекту.

Наилучшим вариантом будет объединить два предыдущих и в общей таблице указать библиотеки с компонентами, которые используются часто, а в таблицу проекта заносить только недостающие библиотеки компонентов для текущего проекта. Единых рекомендаций о том, какие библиотеки в какую таблицу вносить -- нет. Каждый пользователь должен решить это самостоятельно, исходя из своих предпочтений.

```
[[migrating-libraries]]
==== Migrating Legacy Libraries
```

Legacy libraries (`.lib` files) are read-only, but they can be migrated to KiCad version 6 libraries (`.kicad_sym`). KiCad version 6 libraries cannot be viewed or edited by KiCad versions older than 6.0.0.

Legacy libraries can be converted to KiCad 6 libraries by selecting them in the symbol library table and clicking the **Migrate Libraries** button. Multiple libraries can be selected and migrated at once by `kbd:[Ctrl]-clicking` or `kbd:[shift]-clicking`.

Libraries can also be converted one at a time by opening them in the Symbol Editor and saving them as a new library.

```
==== Загрузка устаревших проектов
```

When loading a schematic created prior to the symbol library table implementation, KiCad will attempt to remap the symbol library links in the schematic to the appropriate library table symbols. The success of this process is dependent on several factors:

- оригинальные библиотеки, используемые в схеме, должны быть доступны и не иметь изменений с тех пор, как их компоненты были добавлены в схему;
- необходимо убедиться что недостающие компоненты были "спасены" и сохранены в отдельной библиотеке (rescue), а если эта библиотека существует, убедиться чтобы её содержимое было обновлено;
- содержимое кешированной библиотеки компонентов проекта не будет повреждено;

```
[WARNING]
```

```
====
```

В процессе переопределения библиотек, в каталоге проекта будет создан каталог с резервными копиями файлов, которые подлежат изменению. Но, в любом случае, следует сделать резервную копию всего проекта на случай, если что-то пойдёт не так.

```
====
```

```
[WARNING]
```

```
====
```

Операция по "спасению" компонентов выполняется даже если эта функция отключена. Это необходимо для выявления подходящих компонентов. Не отменяйте эту операцию, иначе процесс переопределения библиотек не сможет успешно завершиться. Все недостающие или ошибочные библиотеки необходимо будет поправить вручную.

```
====
```

```
[NOTE]
```

```
====
```

If the original libraries have been removed and the rescue was not performed, the cache library can be used as a recovery library as a last resort. Copy the cache library to a new file name and add the new library file to the top of the library list using a version of KiCad prior to the symbol library table implementation.

```
====
```

:experimental:

[[symbol-editor]]

== Symbol Editor

[[general-information-about-symbol-libraries]]

=== Общая информация о библиотеках компонентов

A symbol is a schematic element which contains a graphical representation, electrical connections, and text fields describing the symbol. Symbols used in a schematic are stored in symbol libraries. KiCad provides a symbol editing tool that allows you to create libraries, add, delete or transfer symbols between libraries, export symbols to files, and import symbols from files. The symbol editing tool provides a simple way to manage symbols and symbol libraries.

[[symbol-library-overview]]

=== Обзор библиотеки компонентов

Библиотека компонентов состоит из одного или нескольких компонентов. Обычно, компоненты объединяют по функциональному назначению, типу, и/или производителю.

Компонент состоит из:

- * Graphical items (lines, circles, arcs, text, etc.) that determine how symbol looks in a schematic.
- * Pins which have both graphic properties (line, clock, inverted, low level active, etc.) and electrical properties (input, output, bidirectional, etc.) used by the Electrical Rules Check (ERC) tool.
- * Полей, таких как обозначение, значение, назначенное посадочное место для проекта печатной платы и другие.

Symbols can be derived from another symbol in the same library. Derived symbols share the base symbol's graphical shape and pin definitions, but can override the base symbol's property fields (value, footprint, footprint filters, datasheet, description, etc.). Derived symbols can be used to define symbols that are similar to a base part. For example, 74LS00, 74HC00, and 7437 symbols could all be derived from a 7400 symbol. In previous versions of KiCad, derived symbols were referred to as aliases.

Для создания правильного компонента необходимо:

- * Определить, состоит ли компонент из нескольких частей.
- * Defining if the symbol has an alternate body style (also known as a De Morgan representation).
- * Начертить его графическое обозначение используя линии, прямоугольники, окружности, полигоны и текст.
- * Добавить выводы, внимательно назначая каждому графическое представление, имя, номер и электрический тип (вход, выход, трехстабильный, вывод питания и т.п.).
- * Determining if the symbol should be derived from another symbol with the same graphical design and pin definition.
- * Добавить дополнительные поля, такие как имя посадочного места, используемого при проектировании печатной платы, и/или установить их видимость.
- * Документировать компонент, путём заполнения строки описания, указания ссылки на

справочную документацию и пр.

* Сохранить его в спроектированной библиотеке.

[[symbol-library-editor-overview]]

=== Обзор редактора библиотеки компонентов

Основное окно редактора библиотек компонентов показано ниже. Оно состоит из троих панелей инструментов для быстрого доступа к основным командам и поля для просмотра и редактирования. На панелях инструментов расположены не все доступные команды, остальные можно найти в меню.

image::images/ru/libedit_main_window.png[alt="Symbol Editor main window", scaledwidth="95%"]

[[main-toolbar]]

==== Основная панель инструментов

The main tool bar is located at the top of the main window. It consists of the undo/redo commands, zoom commands, symbol properties dialogs, and unit/representation management controls.

[[library-selection-and-maintenance]]
=== Выбор и управление библиотекой

The selection of the current library is possible via the
image:images/icons/search_tree_24.png[Symbol tree icon] icon which shows you all available
libraries and allows you to select one. When a symbol is loaded or saved, it will be put in
this library. The library name of a symbol is the contents of its `Value` field.

[[select-and-save-a-symbol]]
==== Выбор и сохранение компонента

[[symbol-selection]]
===== Выбор компонента

Clicking the image:images/icons/search_tree_24.png[Symbol tree icon] icon on the left tool
bar toggles the treeview of libraries and symbols. Clicking on a symbol opens that symbol.

[NOTE]

Some symbols are derived from other symbols. Derived symbol names are displayed in
italics in the treeview. If a derived symbol is opened, its symbol graphics will not be
editable. Its symbol fields will be editable as normal. To edit the graphics of a base
symbol and all of its derived symbols, open the base symbol.

[[save-a-symbol]]
===== Сохранение компонента

After modification, a symbol can be saved in the current library or a different library.

To save the modified symbol in the current library, click the
image:images/icons/save_24.png[Save icon] icon. The modifications will be written to the
existing symbol.

NOTE: Saving a modified symbol also saves all other modified symbols in the same library.

To save the symbol changes to a new symbol, click **File** -> **Save As...**. The symbol
can be saved in the current library or a different library. A new

name can be set for the symbol.

To create a new file containing only the current symbol, click **File** -> **Export** -> **Symbol...**. This file will be a standard library file which will contain only one symbol.

[[creating-library-symbols]]

=== Создание компонентов библиотеки

[[create-a-new-symbol]]

==== Создание нового компонента

A new symbol can be created by clicking the image:images/icons/new_component_24.png[New symbol icon] icon. You will be asked for a number of symbol properties.

- * A symbol name (this name is used as the default value for the `Value` field in the schematic editor)
- * An optional base symbol to derive the new symbol from. The new symbol will use the base symbol's graphical shape and pin configuration, but other symbol information can be modified in the derived symbol. The base symbol must be in the same library as the new derived symbol.
- * The reference designator prefix (`U`, `C`, `R`...).
- * The number of units per package, and whether those units are interchangeable (for example a 7400 is made of 4 units per package).
- * If an alternate body style (sometimes referred to as a "De Morgan equivalent") is desired.
- * Whether the symbol is a power symbol. Power symbols appear in the "Add Power Port" dialog in the Schematic editor, their `Value` fields are not editable in the schematic, they cannot be assigned a footprint and they are not added to the PCB, and they are not included in the bill of materials.
- * Whether the symbol should be excluded from the bill of materials.
- * Whether the symbol should be excluded from the PCB.

There are also several graphical options.

- * The offset between the end of each pin and its pin name.
- * Whether the pin number and pin name should be displayed.
- * Whether the pin names should be displayed alongside the pins or at the ends of the pins inside the symbol body.

These properties can also be changed later in the <<symbol-properties, Symbol Properties window>>.

image::images/eeschema_new_symbol_properties.png[alt="New symbol properties", scaledwidth="50%"]

Будет создан новый компонент с указанными выше параметрами и представлен в редакторе, как показано ниже.

image::images/ru/eeschema_libedit_new.png[alt="Newly created symbol", scaledwidth="95%"]

The blue cross in the center is the symbol anchor, which specifies the symbol

origin i.e. the coordinates (0, 0). The anchor can be repositioned by selecting the image:images/icons/anchor_24.png[Anchor icon] icon and clicking on the new desired anchor position.

[[create-a-symbol-from-another-symbol]]
==== Создание компонента на основе другого

Часто компонент, который нужно сделать, похож на один из уже существующих в библиотеке. В этом случае легко загрузить и поправить существующий компонент.

- * Загрузите компонент, который нужно взять за основу.
- * Save a new copy of the symbol using **File** -> **Save As...**. The Save As dialog will prompt for a name for the new symbol and the library to save it in.
- * Выполните все необходимые изменения в компоненте.
- * Save the modified symbol.

[[symbol-properties]]
==== Свойства компонента

Symbol properties are set when the symbol is created but they can be modified at any point. To change the symbol properties, click on the image:images/icons/part_properties_24.png[Symbol properties icon] icon to show the dialog below.

image::images/ru/eeschema_properties_for_symbol.png[alt="Свойства компонента", scaledwidth="60%"]

It is important to correctly set the number of units per package and the alternate symbolic representation, if enabled, because when pins are edited or created the corresponding pins for each unit will be affected. If you change the number of units per package after pin creation and editing, there will be additional work to specify the pins and graphics for the new unit. Nevertheless, it is possible to modify these properties at any time.

The graphic options "Show pin number" and "Show pin name" define the visibility of the pin number and pin name text. The option "Place pin names inside" defines the pin name position relative to the pin body. The pin names will be displayed inside the symbol outline if the option is checked. In this case the "Pin Name Position Offset" property defines the shift of the text away from the body end of the pin. A value from 0.02 to 0.05 inches is usually reasonable.

На примере ниже показан компонент с выключенным параметром "Имя вывода внутри". Обратите внимание на положение имени и номера выводов.

image::images/eeschema_uncheck_pin_name_inside.png[alt="Place pin name inside unchecked", scaledwidth="95%"]

[[symbol-name-description-and-keywords]]
==== Symbol Name, Description, and Keywords

The symbol's name is the same as the `Value` field. When the symbol name is changed the value also changes, and vice versa. The symbol's name in the library also changes accordingly.

The symbol description should contain a brief description of the component, such as the component function, distinguishing features, and package options. The keywords should contain additional terms related to the component. Keywords are used primarily to assist in searching for the symbol.

image::images/eeschema_add_symbol_search_description.png[alt="Searching for a symbol in the add a symbol dialog", scaledwidth="65%"]

A symbol's name, description, and keywords are all used when searching for symbols in the Symbol Editor and Add a Symbol dialog. The description and keywords are displayed in the Symbol Library Browser and Add a Symbol dialog.

[[footprint-filters]]
===== Footprint Filters

The footprint filters tab is used to define which footprints are appropriate to use with the symbol. The filters can be applied in the Footprint Assignment tool so that only appropriate footprints are displayed for each symbol.

Multiple footprint filters can be defined. Footprints that match any of the filters will be displayed; if no filters are defined, then all footprints will be displayed.

Filters can use wildcards: `*` matches any number of characters, including zero, and `?` matches zero or one characters. For example, `SOIC-*` would match the `SOIC-8_3.9x4.9mm_P1.27mm` footprint as well as any other footprint beginning with `SOIC-`. The filter `SOT?23` matches `SOT23` as well as `SOT-23`.

image::images/ru/eeschema_libedit_footprint.png[alt="Footprint filters", scaledwidth="70%"]

[[symbols-with-alternate-symbolic-representation]]
==== Компоненты с альтернативным начертанием

If the symbol has an alternate body style defined, one body style must be selected for editing at a time. To edit the normal representation, click the image:images/icons/morgan1_24.png[Normal representation icon] icon.

To edit the alternate representation, click on the image:images/icons/morgan2_24.png[Alternate representation icon] icon. Use the image:images/toolbar_libedit_alias.png[images/toolbar_libedit_part.png] dropdown shown below to select the unit you wish to edit.

image::images/ru/eeschema_libedit_select_unit.png[alt="Selecting a symbol unit", scaledwidth="80%"]

[[graphical-elements]]
=== Графические элементы

Graphical elements create the visual representation of a symbol and contain no electrical connection information. Graphical elements are created with the following tools:

- * Линии и полигоны, задаются начальной и конечной точками.
- * Прямоугольники, задаются двумя противоположными углами.
- * Окружности, задаются центром и радиусом.
- * Дуги, задаются начальной и конечной точками дуги и её центром. Дуга может быть в пределах от 0° до 180°.

Вертикальная панель инструментов с правой стороны основного окна позволяет размещать все графические элементы, необходимые для построения условного графического обозначения компонента.

[[graphical-element-membership]]

==== Графические элементы в частях и дополнительных начертаниях

Каждый графический элемент (линия, дуга, окружность, и пр.) можно определить как общий для всех частей и/или дополнительных начертаний или отдельный для данной части и/или начертания. К параметрам элемента можно легко получить доступ через щелчок правой кнопки мыши на нём для вызова контекстного меню. Ниже показано контекстное меню для линии.

image::images/ru/eeschema_libedit_context_menu.png[alt="Graphic line context menu", scaledwidth="80%"]

Также, можно дважды щёлкнуть на элементе для изменения его параметров. Ниже приведён диалог настройки элемента полигона.

image::images/ru/eeschema_libedit_polyline_properties.png[alt="Graphic line properties", scaledwidth="50%"]

Свойства графического элемента:

- * "Line width" defines the width of the element's line in the current drawing units.
- * "Fill Style" determines if the shape defined by the graphical element is to be drawn unfilled, background filled, or foreground filled.
- * "Common to all units in symbol" determines if the graphical element is drawn for each unit in symbol with more than one unit per package or if the graphical element is only drawn for the current unit.
- * "Common to all body styles (De Morgan)" determines if the graphical element is drawn for each symbolic representation in symbols with an alternate body style or if the graphical element is only drawn for the current body style.

[[graphical-text-elements]]

==== Графический текст

The image:images/icons/text_24.png[Text icon] icon allows for the creation of graphical text. Graphical text is automatically oriented to be readable, even when the symbol is mirrored. Please note that graphical text items are not the same as symbol fields.

[[multiple-units-per-symbol-and-alternate-body-styles]]

=== Компоненты из нескольких частей и с дополнительными начертаниями

Symbols can have up to two body styles (a standard symbol and an alternate symbol often referred to as a "De Morgan equivalent") and/or have more than one

unit per package (logic gates for example). Some symbols can have more than one unit per package each with different symbols and pin configurations.

Consider for instance a relay with two switches, which can be designed as a symbol with three different units: a coil, switch 1, and switch 2. Designing a symbol with multiple units per package and/or alternate body styles is very flexible. A pin or a body symbol item can be common to all units or specific to a given unit or they can be common to both symbolic representation so are specific to a given symbol representation.

By default, pins are specific to a unit and body style. When a pin is common to all units or all body styles, it only needs to be created once. This is also the case for the body style graphic shapes and text, which may be common to each unit, but typically are specific to each body style).

```
[[example-of-a-symbol-with-multiple-noninterchangeable-units]]
==== Example of a Symbol With Multiple Noninterchangeable Units
```

For an example of a symbol with multiple units that are not interchangeable, consider a relay with 3 units per package: a coil, switch 1, and switch 2.

The three units are not all the same, so "All units are interchangeable" should be deselected in the Symbol Properties dialog. Alternatively, this option could have been specified when the symbol was initially created.

```
image::images/ru/eeschema_libedit_not_interchangeable.png[alt="Uncheck all units are interchangeable", scaledwidth="60%"]
```

```
==== Unit A
```

```
image::images/eeschema_libedit_unit1.png[alt="Relay unit A", scaledwidth="45%"]
```

```
==== Unit B
```

```
image::images/eeschema_libedit_unit2.png[alt="Relay unit B", scaledwidth="45%"]
```

```
==== Unit C
```

```
image::images/eeschema_libedit_unit3.png[alt="Relay unit C", scaledwidth="45%"]
```

Unit A does not have the same symbol and pin layout as Units B and C, so the units are not interchangeable.

NOTE: "Synchronized Pins Edit Mode" can be enabled by clicking the `image:images/icons/pin2pin_24.png`[Synchronized pins edit mode icon] icon. In this mode, pin modifications are propagated between symbol units; changes made in one unit will be reflected in the other units as well. When this mode is disabled, pin changes made in one unit do not affect other units. This mode is enabled automatically when "All units are interchangeable" is checked, but it can be disabled. The mode cannot be enabled when "All units are interchangeable" is unchecked or when the symbol only has one unit.

```
[[graphical-symbolic-elements]]
==== Элементы графического обозначения
```

Shown below are properties for a graphic body element. In the relay example above, the three units have different symbolic representations. Therefore, each unit was created separately and the graphical body elements have the "Common to all units in symbol" setting disabled.

`image::images/ru/eeschema_libedit_disable_common.png[alt="Disable common to all units in symbol", scaledwidth="70%"]`

`[[pin-creation-and-editing]]`

=== Создание и редактирование выводов

You can click on the `image:images/icons/pin_24.png`[Pin icon] icon to create and insert a pin. The editing of all pin properties is done by double-clicking on the pin or right-clicking on the pin to open the pin context menu. Pins must be created carefully, because any error will have consequences on the PCB design. Any pin already placed can be edited, deleted, and/or moved.

`[[pin-overview]]`

==== Общие сведения о выводах

A pin is defined by its graphical representation, its name and its number. The pin's name and number can contain letters, numbers, and symbols, but not spaces. For the Electrical Rules Check (ERC) tool to be useful, the pin's electrical type (input, output, tri-state...) must also be defined correctly. If this type is not defined properly, the schematic ERC check results may be invalid.

Важные замечания:

- * Symbol pins are matched to footprint pads by number. The pin number in the symbol must match the corresponding pad number in the footprint.
- * Do not use spaces in pin names and numbers. Spaces will be automatically replaced with underscores (`_`).
- * To define a pin name with an inverted signal (overline) use the `~` (tilde) character followed by the text to invert in braces. For example `~{FO}0` would display `[overline]#FO#0`.
- * If the pin name is empty, the pin is considered unnamed.
- * Pin names can be repeated in a symbol.
- * Pin numbers must be unique in a symbol.

`[[pin-properties]]`

==== Свойства выводов

`image::images/ru/eeschema_libedit_pin_properties.png[alt="Pin properties", scaledwidth="95%"]`

Диалог свойств вывода позволяет редактировать все его параметры. Этот диалог автоматически отображается при создании вывода или при двойном щелчке на существующем выводе. Данный диалог позволяет изменять:

- * The pin name and text size.
- * The pin number and text size.
- * The pin length.
- * The pin electrical type and graphical style.

- * Принадлежность к части или альтернативному начертанию.
- * Pin visibility.
- * <<alternate-pin-definitions,Alternate pin definitions>>.

[[pin-graphic-styles]]
 ==== Pin Graphic Styles

Shown in the figure below are the different pin graphic styles. The choice of graphic style does not have any influence on the pin's electrical type.

image::images/ru/eeschema_libedit_pin_properties_style.png[alt="Pin graphic styles", scaledwidth="95%"]

[[pin-electrical-types]]
 ==== Электрический тип выводов

Choosing the correct electrical type is important for the schematic ERC tool. ERC will check that pins are connected appropriately, for example ensuring that input pins are driven and power inputs receive power from an appropriate source.

[width="100%", cols="25%,75%"]

| Pin Type | Description |
|----------------|--|
| Input | A pin which is exclusively an input. |
| Output | A pin which is exclusively an output. |
| Bidirectional | A pin that can be either an input or an output, such as a microcontroller data bus pin. |
| Tri-state | A three state output pin (high, low, or high impedance) |
| Passive | A passive symbol pin: resistors, connectors, etc. |
| Free | A pin that can be freely connected to any other pin without electrical concerns. |
| Unspecified | A pin for which the ERC check does not matter. |
| Power input | A symbol's power pin. As a special case, power input pins that are marked invisible are automatically connected to the net with the same name. See the <<creating-power-ports, Power Ports section>> for more information. |
| Power output | A pin that provides power to other pins, such as a regulator output. |
| Open collector | An open collector logic output. |
| Open emitter | An open emitter logic output. |
| Unconnected | A pin that should not be connected to anything. |

[[pushing-pin-properties-to-other-pins]]
 ==== Pushing Pin Properties to Other Pins

You can apply the length, name size, or number size of a pin to the other pins in the symbol by right clicking the pin and selecting **Push Pin Length**, **Push Pin Name Size**, or **Push Pin Number Size**, respectively.

image::images/ru/eeschema_libedit_pin_context_menu.png[alt="Pin context menu", scaledwidth="60%"]

[[defining-pins-for-multiple-units-and-alternate-symbolic-representations]]

==== Установка выводов в компонентах с частями и альтернативными начертаниями

Symbols with multiple units and/or graphical representations are particularly problematic when creating and editing pins. The majority of pins are specific to each symbol unit (because each unit has a different set of pins) and to each body style (because the form and position is different between the normal body style and the alternate form).

The symbol library editor allows the simultaneous creation of pins. By default, changes made to a pin are made for all units of a multiple unit symbol and to both representations for symbols with an alternate symbolic representation. The only exception to this is the pin's graphical type and name, which remain unlinked between symbol units and body styles. This dependency was established to allow for easier pin creation and editing in most cases. This dependency can be disabled by toggling the  icon on the main tool bar. This will allow you to create pins for each unit and representation completely independently.

Pins can be common or specific to different units. Pins can also be common to both symbolic representations or specific to each symbolic representation. When a pin is common to all units, it only has to draw once. Pins are set as common or specific in the pin properties dialog.

An example is the output pin in the 7400 quad dual input NAND gate. Since there are four units and two symbolic representations, there are eight separate output pins defined in the symbol definition. When creating a new 7400 symbol, unit A of the normal symbolic representation will be shown in the library editor. To edit the pin style in the alternate symbolic representation, it must first be enabled by clicking the  button on the tool bar. To edit the pin number for each unit, select the appropriate unit using the .

[[pin-table]]
==== Pin Table

Another way to edit pins is to use the Pin Table, which is accessible via the  icon. The Pin Table displays all of the pins in the symbol and their properties in a table view, so it is useful for making bulk pin changes.

Any pin property can be edited by clicking on the appropriate cell. Pins can be added and removed with the  and  icons, respectively.

NOTE: Columns of the pin table can be shown or hidden by right-clicking on the header row and checking or unchecking additional columns. Some columns are hidden by default.

The screenshot below shows the pin table for a quad opamp.

[alt="Pin table", scaledwidth="95%"]

[[alternate-pin-definitions]]
==== Alternate Pin Definitions

Pins can have alternate pin definitions added to them. Alternate pin definitions allow a user to select a different name, electrical type, and graphical style for a pin when the symbol has been placed in the schematic. This can be used for pins that have multiple functions, such as microcontroller pins.

Alternate pin definitions are added in the Pin Properties dialog as shown below. Each alternate definition contains a pin name, electrical type, and graphic style. This microcontroller pin has all of its peripheral functions defined in the symbol as alternate pin names.

image::images/eeschema_libedit_alternate_pin_definitions.png[alt="Alternate pin definitions", scaledwidth="60%"]

Alternate pin definitions are selected in the Schematic Editor once the symbol has been placed in the schematic. The alternate pin is assigned in the Alternate Pin Assignments tab of the Symbol Properties dialog. Alternate definitions are selectable in the dropdown in the Alternate Assignment column.

image::images/eeschema_alternate_pin_assignment_selection.png[alt="Selecting an alternate pin definition", scaledwidth="60%"]

[[symbol-fields]]
=== Поля компонентов

All library symbols are defined with four default fields. The reference designator, value, footprint assignment, and datasheet link fields are created whenever a symbol is created or copied. Only the reference designator and value fields are required.

Symbols defined in libraries are typically defined with only these four default fields. Additional fields such as vendor, part number, unit cost, etc. can be added to library symbols but generally this is done in the schematic editor so the additional fields can be applied to all of the symbols in the schematic.

NOTE: A convenient way to create additional empty symbol fields is to use define field name templates. Field name templates define empty fields that are added to each symbol when it is inserted into the schematic. Field name templates can be defined globally (for all schematics) in the Schematic Editor Preferences, or they can be defined locally (specific to each project) in the Schematic Setup dialog.

[[editing-symbol-fields]]
==== Редактирование полей компонентов

Чтобы изменить существующие поле, нужно вызвать контекстное меню с помощью правой кнопки мыши, как показано на рисунке ниже.

image::images/ru/eeschema_libedit_field_context_menu.png[alt="Symbol field context menu", scaledwidth="35%"]

To add new fields, delete optional fields, or edit existing fields, use the `image:images/icons/part_properties_24.png`[Component properties icon] icon on the main tool bar to open the `<<symbol-properties,Symbol Properties dialog>>`.

Fields are text information associated a the symbol. Do not confuse them with text in the graphic representation of a symbol.

Важные замечания:

- * Modifying the `Value` field changes the name of the symbol. The symbol's name in the library will change when the symbol is saved.

- * The Symbol Properties dialog must be used to edit a field that is empty or has the invisible attribute enabled because such fields cannot be clicked on.

- * The footprint is defined as an absolute footprint using the `LIBNAME:FOOTPRINTNAME` format where `LIBNAME` is the name of the footprint library defined in the footprint library table (see the "Footprint Library Table" section in the PCB Editor manual) and `FOOTPRINTNAME` is the name of the footprint in the library `LIBNAME`.

[[creating-power-ports]]

=== Power Ports

Power ports, or power symbols, are conventionally used to label a wire as part of a power net, like `VCC`, `+5V`, or `GND`. In the schematic below, the `+3.3V` and `GND` symbols are power ports. In addition to acting as a visual indicator that a net is a power rail, a power port will determine the name of the net it is attached to. This is true even if there is another net label attached to the net; the net name determined by the power symbol overrides any other net names.

`image::images/eeschema_power_port_example.png[alt="Power port example", scaledwidth="60%"]`

It may be useful to place power symbols in a dedicated library. KiCad's symbol library places power symbols in the `power` library, and users may create libraries to store their own power symbols. If the "Define as power symbol" box is checked in a symbol's properties, that symbol will appear in the Schematic Editor's "Add Power Port" dialog for convenient access.

Power symbols are handled and created the same way as normal symbols, but there are several additional considerations described below. They consist of a graphical symbol and a pin of the type "Power input" that is marked hidden.

Below is an example of a `GND` power symbol.

`image::images/ru/eeschema_libedit_power_symbol.png[alt="Editing a power symbol", scaledwidth="95%"]`

==== Creating a Power Port Symbol

Power Port symbols consist of a pin of type "Power input" that is marked invisible. Invisible power input pins have a special property of automatically connecting to a net with the same name as the pin name. A net that is wired to an invisible power input pin will therefore be named after the pin, even if

there are other net labels on the net. This connection is global.

NOTE: If the power symbol has the "Define as power symbol" property checked, the power input pin does not need to be marked invisible. However, the convention is to make these pins invisible anyway.

```
image::images/eeschema_libedit_power_symbol_pin.png[alt="Power symbol pin",  
scaledwidth="60%"]
```

Для создания символа питания применяйте следующие шаги:

- * Add a pin of type "Power input", with "Visible" unchecked, and the pin named according to the desired net. Make the pin number `1`, the length `0`, and set the graphic style to "Line". The pin name establishes the connection to the net; in this case the pin will automatically connect to the net `GND`. The pin number, length, and line style do not matter electrically.

- * Place the pin on the symbol anchor.

- * Use the shape tools to draw the symbol graphics.

- * Set the symbol value. The symbol value does not matter electrically, but it is displayed in the schematic. To eliminate confusion, it should match the pin name (which determines the connected net name).

- * Check the "Define as power symbol" box in Symbol Properties window. This makes the symbol appear in the "Add Power Port" dialog, makes the `Value` field read-only in the schematic, prevents the symbol from being assigned a footprint, and excludes the symbol from the board, BOM, and netlists.

- * Set the symbol reference and uncheck the "Show" box. The reference text is not important except for the first character, which should be `#`. For the power port shown above, the reference could be `#GND`. Symbols with references that begin with `#` are not added to the PCB, are not included in Bill of Materials exports or netlists, and they cannot be assigned a footprint in the footprint assignment tool. If a power port's reference does not begin with `#`, the character will be inserted automatically when the annotation or footprint assignment tools are run.

An easier method to create a new power port symbol is to use another symbol as a starting point, <<creating-a-symbol-from-another-symbol,as described earlier>>.

NOTE: When modifying an existing power port symbol, make sure to rename the pin name so that the new symbol connects to the appropriate power net.

```
[[simulator]]
== Симулятор ==
```

KiCad provides an embedded electrical circuit simulator using <http://ngspice.sourceforge.net> [ngspice] as the simulation engine.

При работе с симулятором, будут полезны официальные библиотеки `_pspice_`. Они содержат основные компоненты, используемые при симуляции, такие как источники напряжения/тока или транзисторы с нумерацией выводов, которая соответствует порядку узлов (node) в спецификации ngspice.

Также, имеется несколько демонстрационных проектов, показывающих возможности симулятора. Их можно найти в каталоге `_demos/simulation_`.

=== Назначение моделей

Перед началом симуляции, необходимо назначить компонентам Spice-модели.

Каждому компоненту можно назначить только одну модель, даже если компонент состоит из нескольких частей. В последнем случае, модель назначается первой части.

```
[[sim-passive-models]]
```

Пассивным компонентам, обозначения которых совпадают с типом элемента в Spice-записи (`_R*_` для резисторов, `_C*_` для конденсаторов, `_L*_` для индуктивностей), модели будут назначены косвенно, а поле значения будет восприниматься как свойство модели.

[NOTE]

Имейте в виду, что в Spice множитель 'M' обозначает мили, а 'Meg' -- мега. Если желаете использовать 'M' в качестве множителя мега, установите соответствующий параметр в `<<sim-settings, диалоговом окне настройки симуляции>>`.

Информация для spice-моделей хранится в виде текста в полях компонента и её можно легко указать с помощью редактора компонентов или непосредственно в редакторе схем. Откройте диалог редактирования свойств компонента и нажмите кнопку `_Редактировать Spice модель_` для вызова диалогового окна редактора Spice модели.

Редактор Spice моделей имеет три вкладки, которые соответствуют трём разным типам моделей. Также имеется два параметра, общих для всех типов:

```
[width="90%", cols="30%a,70%a"]
```

```
|=====
```

```
|Не симулировать компонент
```

```
|Если отмечен, компонент исключается из симуляции.
```

```
|Изменить последовательность выводов
```

```
|Позволяет переопределить выводы компонента для соответствия описанию узлов модели.
```

Необходимо указать номера выводов в той последовательности, в которой их ожидает модель.

'Пример:' +

```
_____  
`* connections:` +  
`* 1: non-inverting input` +  
`* 2: inverting input` +  
`* 3: positive power supply` +  
`* 4: negative power supply` +  
`* 5: output` +  
`.subckt tl071 1 2 3 4 5`  
_____
```

image::images/opamp_symbol.png[alt="Обозначение обычного операционного усилителя"]

Чтобы сопоставить выводы компонента с узлами Spice модели, описанными выше, необходимо задать следующее значение для данного параметра: "1{nbsp}3{nbsp}5{nbsp}2{nbsp}4". Это перечень номеров выводов, который соответствует порядку узлов Spice модели.

|====

==== Пассивный

Вкладка Пассивный позволяет назначить модель (резистор, конденсатор или индуктивность) компоненту. Этот параметр используется редко, так как обычно пассивным элементам модели назначаются <<sim-passive-models, косвенно>>. Если же обозначение компонента не совпадает с необходимым типом модели, то нужно явно указать параметры на данной вкладке.

[NOTE]

Явно указанные модели имеют больший приоритет перед косвенно назначенными моделями. Это значит, что как только модель назначена вручную, поля обозначения и значения не принимаются во внимание при симуляции. Это может привести к путанице, когда значение модели не совпадает со значением, указанным на схеме.

image::images/ru/sim_model_passive.png[alt="Вкладка Пассивный в редакторе моделей"]

[width="90%", cols="30%a,70%a"]

|====

|Тип

|Выбор типа компонента (резистор, конденсатор или индуктор).

|Значение

|Определяет свойства компонента (сопротивление, ёмкость или индуктивность).

В значении могут использоваться приставки, которые используются в описании Spice-моделей (они перечислены под текстовым полем ввода).

В качестве десятичного разделителя необходимо использовать точку.

Заметьте, Spice неверно воспринимает значения, в которых приставка выступает в роли десятичного разделителя (например: 1k5).

|====

==== Модель

Вкладка Модель используется для назначения полупроводниковых или сложных моделей, которые определены в отдельном файле библиотеки. Библиотеки Spice-моделей часто

предоставляются производителями компонентов.

В основном текстовом поле отображается содержимое выбранного файла библиотеки. Обычно в библиотеке дополнительно содержится описание моделей и порядок их узлов.

image::images/ru/sim_model_subckt.png[alt="Вкладка Модель редактора параметров симуляции"]

[width="90%", cols="30%,70%a"]

|=====

|Библиотека

|Путь к файлу Spice-библиотеки. Этот файл будет использоваться симулятором, он подключается с помощью директивы `_.include_`.

|Модель

|Выбранная модель компонента. После выбора файла библиотеки, список заполняется доступными моделями для выбора.

|Тип

|Выбранный тип модели (макромодель (subcircuit), BJT, MOSFET или диод). Обычно тип устанавливается автоматически при выборе модели.

|=====

==== Источник

Вкладка `_Источник_` используется для настройки моделей питания или источников сигналов. Здесь имеется две секции: `_Анализ DC/AC_` и `_Анализ переходных процессов_`. В каждой задаются параметры источника для соответствующего типа симуляции.

Параметр `_Тип источника_` применяется ко всем типам симуляций.

image::images/ru/sim_model_source.png[alt="Вкладка Источник редактора параметров симуляции"]

Для получения более подробной информации об источниках обратитесь к разделу 4 (Источники напряжения и тока) <http://ngspice.sourceforge.net/docs/ngspice-27-manual.pdf> [документации ngspice].

[[sim-directives]]

=== Директивы Spice

It is possible to add Spice directives by placing them in text fields on a schematic sheet. This approach is convenient for defining the default simulation type. This functionality is limited to Spice directives starting with a dot (e.g. ``.tran 10n 1m``), it is not possible to place additional components using text fields.

=== Симуляция

Для запуска симуляции откройте окно `_Spice симулятора_` через меню редактора схем `_Инструменты->Симулятор_`.

image::images/ru/sim_main_dialog.png[alt="Основное окно симулятора"]

Окно разделено на несколько секций:

```
* <<sim-toolbar,Панель инструментов>>
* <<sim-plot-panel,Панель графиков>>
* <<sim-output-console,Сообщения консоли>>
* <<sim-signals-list,Перечень сигналов>>
* <<sim-cursors-list,Перечень курсоров>>
* <<sim-tune-panel,Панель подстройки>>
```

==== Меню

```
[[sim-menu-file]]
```

===== Меню "Файл"

```
[width="90%", cols="30%,70%"]
```

|=====

```
|Новый график |Создать новую вкладку на панели графиков.
|Открыть работу |Открыть перечень сигналов для построения графиков.
|Сохранить работу |Сохранить перечень сигналов, построенных на графике.
|Сохранить как изображение |Экспорт текущего графика в png-файл.
|Сохранить как файл .csv |Экспорт данных текущего графика в csv-файл.
|Выйти из симуляции |Закрыть окно симулятора.
```

|=====

```
[[sim-menu-simulation]]
```

===== Симуляция

```
[width="90%", cols="30%,70%"]
```

|=====

```
|Запустить симуляцию |Выполнить симуляцию используя текущие настройки.
|Добавить сигналы... |Открыть диалог для выбора сигналов, графики которых нужно построить.
|Пробник из схемы |Запустить инструмент для работы со схемой <<sim-probe-tool,Пробник>>.
|Подстроить значение компонента |Запустить инструмент <<sim-tuner-tool,Подстройка>>.
|Показать Spice список цепей... |Открыть окно, в котором будет показан список цепей для
исследуемой схемы.
|Настройки... |Открыть <<sim-settings,диалоговое окно настройки симуляции>>.
```

|=====

```
[[sim-menu-view]]
```

===== Меню "Вид"

```
[width="90%", cols="30%,70%"]
```

|=====

```
|Увеличить |Увеличить масштаб текущего графика.
|Уменьшить |Уменьшить масштаб текущего графика.
|Вписать в экран |Подстроить масштаб графика так, чтобы он полностью поместился на экране.
|Показать сетку |Показать или скрыть сетку.
|Показать надписи |Показать или скрыть надписи графика.
```

|=====

```
[[sim-toolbar]]
```

===== Панель инструментов

```
image::images/ru/sim_main_toolbar.png[alt="Панель инструментов окна симуляции"]
```

Эта панель предоставляет доступ к часто используемым командам.

```
[width="90%", cols="30%,70%"]
```

```
|====
```

```
|Запустить/остановить симуляцию |Начать или остановить работу симулятора.
```

```
|Добавить сигналы |Открыть диалоговое окно для выбора сигналов, графики которых нужно построить.
```

```
|Пробник |Активировать инструмент для работы со схемой <<sim-probe-tool,Пробник>>.
```

```
|Подстройка |Активировать инструмент <<sim-tuner-tool,Подстройка>>.
```

```
|Установки |Открыть <<sim-settings,диалоговое окно настройки симуляции>>.
```

```
|====
```

```
[[sim-plot-panel]]
```

==== Панель графиков

Результат симуляции отображается в виде графиков. Можно создать несколько графиков на отдельных вкладках, но только текущий график будет обновляться при выполнении симуляции. Это позволяет сравнивать результаты симуляции при разных условиях.

Вид графиков можно настроить включая/выключая сетку или надписи через меню <<sim-menu-view,Вид>>. Если надписи отображаются, их положение можно менять, перетаскивая левой кнопкой мыши.

Управление панелью графиков:

- * колесо мыши увеличивает или уменьшает масштаб
- * правая кнопка мыши открывает контекстное меню для настройки изображения
- * выделите прямоугольную область для её увеличения во весь экран
- * перетащите курсор для изменения координат

```
[[sim-output-console]]
```

==== Сообщения консоли

Сообщения консоли -- это сообщения от симулятора. Рекомендуется следить за этими сообщениями и проверять наличие ошибок или предупреждений.

```
[[sim-signals-list]]
```

==== Перечень сигналов

Содержит список сигналов, которые отображены на графике.

Управление перечнем сигналов:

- * щелчок правой кнопки мыши открывает контекстное меню для скрытия сигналов или включения/выключения курсора
- * двойной щелчок мыши скроет сигнал

```
[[sim-cursors-list]]
```

==== Перечень курсоров

Содержит список курсоров и их координаты. Для каждого сигнала может быть показан свой курсор. Видимость курсора включается/выключается в перечне <<sim-signals-list,Сигналов>>.

```
[[sim-tune-panel]]
```

==== Панель подстройки

Здесь содержатся компоненты, выбранные с помощью инструмента <<sim-tuner-tool,Подстройка>>. Панель подстройки позволяет пользователю быстро изменять

параметры компонента и наблюдать влияние на результат симуляции -- каждый раз при изменении значения компонента, симуляция запускается заново и график обновляется.

У каждого компонента на панели имеется несколько элементов управления:

- * В верхнем текстовом поле устанавливается максимальное значение.
- * В среднем текстовом поле устанавливается текущее значение.
- * В нижнем текстовом поле устанавливается минимальное значение.
- * Ползунок позволяет пользователю плавно менять значение компонента.
- * Кнопка `_Сохранить_` записывает текущее значение, выбранное с помощью ползунка, в поле значения компонента на схеме.
- * Кнопка `_X_` удаляет компонент из панели подстройки и восстанавливает его начальное значение.

В трёх текстовых полях можно использовать множители единиц измерения в формате Spice.

```
[[sim-tuner-tool]]
```

```
==== Подстройка
```

Инструмент подстройки позволяет пользователю выбрать компоненты для настройки его значения.

Чтобы выбрать компонент для подстройки, после активации инструмента щёлкните левой кнопкой мыши на компоненте в редакторе схем. Выбранные компоненты появятся на панели `<<sim-tune-panel,подстройка>>`. Подстраивать можно только пассивные компоненты.

```
[[sim-probe-tool]]
```

```
==== Пробник
```

Инструмент "Пробник" предоставляет простой путь для выбора сигналов, которые нужно отобразить на графике.

Чтобы добавить сигнал на график, активируйте инструмент и нажмите левой кнопкой мыши на интересующем проводнике в редакторе схем.

```
[[sim-settings]]
```

```
==== Параметры симуляции
```

```
image::images/ru/sim_settings.png[alt="Диалог параметров симуляции"]
```

Диалоговое окно параметров симуляции позволяет пользователю выбрать тип симуляции и её параметры. Здесь имеется четыре вкладки:

- * АС
- * DC переход
- * Переходной процесс
- * Пользовательская

На первых трёх вкладках имеются формы, в которых можно указать параметры симуляции. Последняя вкладка позволяет пользователю настроить процесс симуляции путём ручного ввода Spice-директив. Более подробную информацию о типах симуляции и их параметрах можно найти в разделе 1.2 <http://ngspice.sourceforge.net/docs/ngspice-27-manual.pdf> [документации ngspice].

Альтернативный путь настройки процесса симуляции -- ввести <<sim-directives,Spice-директивы>> в текстовых полях на схеме. Любые директивы указанные в текстовых полях и связанные с типом симуляции переопределяются параметрами, выбранными в диалоге настроек. Это значит, что после ввода параметров в диалоге настроек, эти параметры будут использоваться вместо директив указанных на схеме до тех пор, пока процесс симуляции не будет запущен заново.

Имеется два параметра, общих для всех типов симуляции:

```
[width="90%", cols="30%,70%"]
```

```
|====
```

```
|Подстроить значения пассивных компонентов |Заменяет значения пассивных компонентов,  
путём преобразования общего формата записи значений в формат Spice.
```

```
|Добавить полный путь для директивы .include библиотека |Параметр следит за тем,  
чтобы файл библиотеки Spice-моделей был сохранён в виде полного пути.
```

```
Обычно ngspice требует использования полного пути для доступа к файлам библиотек.
```

```

===== Mouse and Touchpad
```

```
[width="100%",cols="40%,60%",]
```

```
|=====
```

```
|Center and warp cursor on zoom | If checked, the pointed location is warped  
to the screen center when zooming in/out.
```

```
|Use touchpad to pan |When enabled, view is panned using scroll wheels (or  
touchpad gestures) and to zoom one needs to hold kbd:[Ctrl]. Otherwise scroll  
wheels zoom in/out and kbd:[Ctrl]/kbd:[Shift] are the panning modifiers.
```

```
|Pan while moving object |If checked, automatically pans the window  
if the cursor leaves the window during drawing or moving.
```

```
|=====
```

```
[[preferences-controls]]
```

```
==== Hotkeys
```

Redefine hotkeys.

```
image::images/en/options_hotkeys.png[alt="Hotkeys settings",scaledwidth="70%"]
```

Select a new hotkey by double clicking an action or right click on an action to show a popup menu:

```
[width="100%",cols="40%,60%",]
```

```
|=====
```

```
|Edit | Define a new hotkey for the action (same as double click).
```

```
|Undo Changes | Reverts the recent hotkey changes for the action.
```

```
|Clear Assigned Hotkey |
```

```
|Restore Default | Sets the action hotkey to its default value.
```

```
|=====
```

```
[[preferences-display]]
```

```
==== Display Options
```

```
image::images/en/options_display.png[alt="Display options",scaledwidth="70%"]
```

```
[width="100%",cols="40%,60%",]
```

```
|=====
```

```
|Grid Size| Grid size selection.
```

It is *recommended* to work with normal grid (0.050 inches or 1,27 mm). Smaller grids are used for component building.

```
|Bus thickness |Pen size used to draw buses.
```

```
|Line thickness |Pen size used to draw objects that do not have a specified pen size.
```

```
|Part ID notation |Style of suffix that is used to denote symbol units (U1A, U1.A, U1-1, etc.)
```

```
|Icon scale| Adjust toolbar icons size.
```

```
|Show Grid | Grid visibility setting.
```

```
|Restrict buses and wires to H and V orientation| If checked, buses and wires are drawn only with vertical or horizontal lines.
```

Otherwise buses and wires can be placed at any orientation.

```
|Show hidden pins: |Display invisible (or __hidden__) pins, typically power pins.
```

```
|Show page limits |If checked, shows the page boundaries on screen.
```

```
|Footprint previews in symbol chooser| Displays a footprint preview frame and
```

footprint selector when placing a new symbol.

Note: it may cause problems or delays, use at your own risk.

|=====

[[preferences-editing]]

==== Editing Options

image::images/en/options_editing.png[alt="Editing settings",scaledwidth="70%"]

[width="100%",cols="40%,60%",]

|=====

|Measurement units |Select the display and the cursor coordinate units (inches or millimeters).

|Horizontal pitch of repeated items |

Increment on X axis during element duplication (default: 0)

(after placing an item like a symbol, label or wire,

a duplication is made by the kbd:[Insert] key)

|Vertical pitch of repeated items| Increment on Y axis during element duplication (default: 0.100 inches or 2,54 mm).

|Increment of repeated labels |Increment of label value during duplication of texts ending in a number, such as bus members (usual value 1 or -1).

|Default text size |Text size used when creating new text items or labels.

|Auto-save time interval |Time in minutes between saving backups.

|Automatically place symbol fields | If checked, symbol fields (e.g. value and reference) in newly placed symbols might be moved to avoid collisions with other items.

|Allow field autoplace to change justification | Extension of 'Automatically place symbol fields' option. Enable text justification adjustment for symbol fields when placing a new part.

|Always align autoplaced fields to the 50 mil grid |Extension of 'Automatically place symbol fields' option. If checked, fields are autoplaced using 50 mils grid, otherwise they are placed freely.

|=====

[[preferences-colors]]

==== Colors

Color scheme for various graphic elements. Click on any of the color swatches to select a new color for a particular element.

////
```

```
[[custom-netlist-and-bom-formats]]
```

```
=== Custom Netlist and BOM Formats
```

KiCad can output netlists and BOMs in various formats, and users can define new formats if desired.

The process of exporting a netlist is described in the <<netlist-export,netlist export section>>. BOM output is described in the <<bom-export,BOM export section>>.

The following section describes how to create an exporter for a new output format.

```
[[adding-new-netlist-generators]]
```

```
==== Adding new netlist generators
```

New netlist generators are added by clicking the **Add Generator...** button.

```
image::images/ru/eeschema_netlist_dialog_add_plugin.png[alt="Custom Netlist Generator",scaledwidth="40%"]
```

New generators require a name and a command. The name is shown in the tab label, and the command is run whenever the **Export Netlist** button is clicked.

When the netlist is generated, KiCad creates an intermediate XML file which contains all of the netlist information from the schematic. The generator command is then run in order to transform the intermediate netlist into the desired netlist format.

The netlist command must be set up properly so that the netlist generator script takes the intermediate netlist file as input and outputs the desired netlist file. The `%I` argument represents the input intermediate netlist filename and the `%O` argument represents the output netlist filename. The exact netlist command will depend on the generator script used.

Python and XSLT are commonly used tools to create custom netlist generators.

```
==== Adding a new BOM generator
```

BOMs can also be created from the intermediate netlist file. BOM generators can be automatically launched from the Schematic Editor with the BOM export tool. Adding a new netlist generator to the BOM export tool is described in the <<bom-export,BOM export tool documentation>>.

==== Формат командной строки

Consider the following example which uses ``xsltproc`` to generate a netlist in PADS ASC format. ``xsltproc`` converts the intermediate netlist using the ``netlist_form_pads-pcb.asc.xsl`` stylesheet to define the output format:

```
`xsltproc -o %0.net /usr/share/kicad/plugins/netlist_form_pads-pcb.asc.xsl %I`
```

The purpose of each part of the command is as follows:

```
[width="100%", cols="58%,42%"]
```

```
|=====
|`xsltproc` |A tool to convert an XML file (the intermediate netlist) according
|to an XSLT stylesheet.
```

```
|`-o %0.net` |Output filename. `%0` is replaced with the name of the
|intermediate netlist file, which is `<schematic name>.xml`. Therefore in this
|example the complete output filename is `<schematic name>.xml.net`. An arbitrary
|output filename can be specified if desired with `-o <filename>`.
```

```
|`/usr/share/kicad/plugins/netlist_form_pads-pcb.asc.xsl` |XSLT stylesheet which
|determines how the output is formatted. This particular stylesheet is included
|with KiCad, but custom stylesheets can also be created.
```

```
|`%I` |Input (intermediate netlist) filename. `%I` is replaced with the name of
|the intermediate netlist file, which is `<schematic name>.xml`.
```

```
|=====
```

For netlist generators that do not use ``xsltproc``, the generator command will differ.

==== Промежуточный файл списка цепей

When exporting BOM files and netlists, KiCad creates an intermediate netlist file and then runs a separate tool which post-processes the intermediate netlist into the desired netlist or BOM format.

The intermediate netlist uses XML syntax. It contains a large amount of data about the design. Depending on the output (BOM or netlist), different subsets of the complete intermediate netlist file will be included in the final output file.

The structure of the intermediate netlist file is described in detail [<<intermediate-netlist-structure, later>>](#).

Because the conversion from intermediate netlist file to output netlist or BOM is a text-to-text transformation, the post-processing filter can be written using Python, XSLT, or any other tool capable of taking XML as input.

NOTE: XSLT is not recommended for new netlist or BOM exporters; Python or another tool should be used instead. Beginning with KiCad 7, ``xsltproc`` is no longer installed with KiCad, although it can be installed separately.

Nevertheless, several examples of netlist exporters using XSLT are included below.

[[intermediate-netlist-structure]]

==== Структура промежуточного файла списка цепей

Этот пример даёт представление о формате файла списка цепей.

```
```.xml
<?xml version="1.0" encoding="utf-8"?>

</export>
```

## Основные элементы файла списка цепей

Промежуточный файл насчитывает пять разделов.

- Раздел оглавления (design).
- Раздел компонентов (components).
- Раздел частей компонента (libparts).
- Раздел библиотек (libraries).
- Раздел цепей (nets).

The file content has the delimiter `<export>`

```
... ``" data-lang="xml ... ``">[[the-header-section]]
```

==== Оглавление

The header has the delimiter ``<design>``

```
``xml <design> <source>F:\kicad_aux\netlist_test\netlist_test.sch</source>
<date>21/08/2010 08:12:08</date> <tool>eeschema (2010-08-09 BZR 2439)-unstable</tool>
</design> ``
```

Этот раздел может содержать подраздел с комментариями.

```
[[the-components-section]]
```

==== Компоненты

The component section has the delimiter ``<components>``

```
``xml <components> <comp ref="P1"> <value>CONN_4</value> <libsource lib="conn"
part="CONN_4"/> <sheetpath names="/" tstamps="/" /> <tstamps>4C6E2141</tstamps> </comp>
</components> `` This section contains the list of components in your schematic. Each
component is described like this:
```

```
``xml <comp ref="P1"> <value>CONN_4</value> <libsource lib="conn" part="CONN_4"/>
<sheetpath names="/" tstamps="/" /> <tstamps>4C6E2141</tstamps> </comp> ``
```

```
[width="100%", cols="37%,63%"]
```

```
|=====
|Element name |Element description
```

```
|`libsource` |name of the lib where this component was found.
```

```
|`part` |component name inside this library.
```

```
|`sheetpath` |path of the sheet inside the hierarchy: identify the sheet
within the full schematic hierarchy.
```

```
|`tstamps` |timestamp of the component.
```

```
|=====
```

```
[[note-about-time-stamps-for-components]]
```

==== Note about time stamps for components

To identify a component in a netlist and therefore on a board, the timestamp reference is used as unique for each component. However KiCad provides an auxiliary way to identify a component which is the corresponding footprint on the board. This allows the re-annotation of components in a schematic project and does not lose the link between the component and its footprint.

Метка времени -- это уникальный идентификатор для каждого компонента или листа в проекте схемы. Но, в сложных иерархиях, где один файл схемы может использоваться несколькими листами, компоненты из этих листов имеют одни и те же метки времени.

A given sheet inside a complex hierarchy has an unique identifier: its sheetpath. A given component (inside a complex hierarchy) has a unique identifier: the sheetpath and its timestamp.

```
[[the-libparts-section]]
```

==== Части компонента

The libparts section has the delimiter ``<libparts>``, and the content of this section is defined in the schematic libraries.

```
``xml
<libparts>
```

| Element name | Element description                                                                                                               |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------|
| <footprints> | The symbol's footprint filters. Each footprint filter is in a separate <fp> tag.                                                  |
| <fields>     | The symbol's fields. Each field's name and value is given in a separate `<field name="fieldname">...</field>` tag.                |
| <pins>       | The symbol's pins. Each pin is given in a separate <pin num="pinnum" type="pintype"/> tag. Possible pintypes are described below. |

Possible electrical pin types are:

| Pintype        | Description                                      |
|----------------|--------------------------------------------------|
| Input          | Usual input pin                                  |
| Output         | Usual output                                     |
| Bidirectional  | Input or Output                                  |
| Tri-state      | Bus input/output                                 |
| Passive        | Usual ends of passive components                 |
| Unspecified    | Unknown electrical type                          |
| Power input    | Power input of a component                       |
| Power output   | Power output like a regulator output             |
| Open collector | Open collector often found in analog comparators |
| Open emitter   | Open emitter sometimes found in logic            |
| Not connected  | Must be left open in schematic                   |

## Библиотеки

The libraries section has the delimiter `<libraries>`. This section contains the list of schematic libraries used in the project.

```
<libraries>
 <library logical="device">
 <uri>F:\kicad\share\library\device.lib</uri>
 </library>
 <library logical="conn">
 <uri>F:\kicad\share\library\conn.lib</uri>
 </library>
</libraries>
```

## Цепи

The nets section has the delimiter `<nets>`. This section describes the connectivity of the schematic by listing all nets and the pins connected to each net.

```
<nets>
 <net code="1" name="GND">
 <node ref="U1" pin="7"/>
 <node ref="C1" pin="2"/>
 <node ref="U2" pin="7"/>
 <node ref="P1" pin="4"/>
 </net>
 <net code="2" name="VCC">
 <node ref="R1" pin="1"/>
 <node ref="U1" pin="14"/>
 <node ref="U2" pin="4"/>
 <node ref="U2" pin="1"/>
 <node ref="U2" pin="14"/>
 <node ref="P1" pin="1"/>
 </net>
</nets>
```

Обычно цепь состоит из следующего:

```
<net code="1" name="GND">
 <node ref="U1" pin="7"/>
 <node ref="C1" pin="2"/>
 <node ref="U2" pin="7"/>
 <node ref="P1" pin="4"/>
</net>
```

| Element name | Element Description                                                                                                   |
|--------------|-----------------------------------------------------------------------------------------------------------------------|
| net code     | an internal identifier for this net                                                                                   |
| name         | the net name                                                                                                          |
| node         | the pin (identified by <code>pin</code> ) of a symbol (identified by <code>ref</code> ) which is connected to the net |

## Example netlist exporters

Some example netlist exporters using XSLT are included below.

XSLT itself is an XML language very suitable for XML transformations. The `xsltproc` program can be used to read the Intermediate XML netlist input file, apply a style-sheet to transform the input, and save the results in an output file. Use of `xsltproc` requires a style-sheet file using XSLT conventions. The full conversion process is handled by KiCad, after it is configured once to run `xsltproc` in a specific way.

The document that describes XSL Transformations (XSLT) is available here: <http://www.w3.org/TR/xslt>

**NOTE**

When writing a new netlist exporter, consider using Python or another tool rather than XSLT.

**PADS netlist example using XSLT**

The following example shows how to create an exporter for the PADS netlist format using `xlstproc`.

The PADS netlist format is comprised of two sections:

- A list of footprints
- A list of nets, together with the pads connected to each net.

Below is an XSL style-sheet which converts the intermediate netlist file to the PADS netlist format.

```

<?xml version="1.0" encoding="ISO-8859-1"?>
<!--XSL style sheet to Eeschema Generic Netlist Format to PADS netlist format
Copyright (C) 2010, SoftPLC Corporation.
GPL v2.

How to use:
https://lists.launchpad.net/kicad-developers/msg05157.html
-->

<!DOCTYPE xsl:stylesheet [
 <!ENTITY nl "
"> <!--new line CR, LF -->
]>

<xsl:stylesheet version="1.0" xmlns:xsl="http://www.w3.org/1999/XSL/Transform"> <xsl:output
method="text" omit-xml-declaration="yes" indent="no"/>

<xsl:template match="/export">
 <xsl:text>*PADS-PCB*&nl;*PART*&nl;</xsl:text>
 <xsl:apply-templates select="components/comp"/>
 <xsl:text>&nl;*NET*&nl;</xsl:text>
 <xsl:apply-templates select="nets/net"/>
 <xsl:text>*END*&nl;</xsl:text>
</xsl:template>

<!-- for each component -->
<xsl:template match="comp">
 <xsl:text> </xsl:text>
 <xsl:value-of select="@ref"/>
 <xsl:text> </xsl:text>
 <xsl:choose>
 <xsl:when test = "footprint != ' ' ">
 <xsl:apply-templates select="footprint"/>
 </xsl:when>
 <xsl:otherwise>
 <xsl:text>unknown</xsl:text>
 </xsl:otherwise>
 </xsl:choose>
 <xsl:text>&nl;</xsl:text>
</xsl:template>

<!-- for each net -->
<xsl:template match="net">
 <!-- nets are output only if there is more than one pin in net -->
 <xsl:if test="count(node)>1">
 <xsl:text>*SIGNAL* </xsl:text>
 <xsl:choose>
 <xsl:when test = "@name != ' ' ">
 <xsl:value-of select="@name"/>
 </xsl:when>
 <xsl:otherwise>
 <xsl:text>N-</xsl:text>
 <xsl:value-of select="@code"/>
 </xsl:otherwise>
 </xsl:choose>
 <xsl:text>&nl;</xsl:text>
 <xsl:apply-templates select="node"/>
 </xsl:if>
</xsl:template>

<!-- for each node -->

```

Командная строка для запуска этого преобразования:

```
kicad\bin\xsltproc.exe -o test.net kicad\bin\plugins\netlist_form_pads-pcb.xsl test.tmp
```

## Cadstar netlist example using XSLT

The following example shows how to create an exporter for the Cadstar netlist format using `x1stproc`.

The Cadstar format is comprised of two sections:

- The footprint list
- The Nets list: grouping pads references by nets

Below is an XSL style-sheet which converts the intermediate netlist file to the Cadstar netlist format.

```

<?xml version="1.0" encoding="ISO-8859-1"?>
<!--XSL style sheet to Eeschema Generic Netlist Format to CADSTAR netlist format
